## INTRODUCTION<sup>1</sup>

THE majority of the spiders considered in this and the previous volume are found in forest. One clear characteristic of the invertebrate forest fauna in New Zealand is that it forms a 'closed community' in the sense that introduced invertebrates rarely become established in virgin forest in direct contrast to lowland grassland and pasture habitats where fauna consists mainly of recent introductions, mostly by man but possibly others by transoceanic dispersal. The subalpine fauna is however strongly endemic. It is probable that the invertebrate forest fauna represents a fairly complete faunistic cross-section of those animals characteristic of the Gondwanaland land mass prior to the separation of New Zealand in the late Mesozoic and the relationship of these animals even when considered as a whole is undoubtedly with the southern continents and subantarctic islands. With the full description of the Amaurobioidea-Dictynoidea section of the New Zealand spider fauna we now have a distorted picture of the true situation as it would appear that this small land area retains a much broader spectrum of this southern fauna than do the main southern continents. However we know of many related but as yet undescribed spiders from Australia, particularly Tasmania and the eastern portion of the mainland, and as very little systematic collecting has been undertaken over much of this area many more undoubtedly will be discovered in the future. A similar situation probably holds for southern South America but the representation of this group in South Africa seems to be limited. In the subantarctic islands only a few species have been recorded but the proportion of these when compared with the total fauna is quite high and fully comparable with the situation in New Zealand. The degree of relationship of New Zealand spiders with Australian and South America is mainly at a generic level but it probable that, as the Australian fauna becomes better known, more genera will be found to be common to both countries.

The New Zealand forest fauna is also characterised by extensive geographical speciation, much of which has little direct relationship with the present day or recent distribution of forest. Much of this speciation can be attributed to changes in the disposition of the New Zealand land mass during the Tertiary. Patterns of speciation follow closely those discussed in detail in an earlier paper on the harvestmen (Forster, 1954. Canterbury Museum Bulletin No. 2). The New Zealand

forest spiders do not appear to extend their range far beyond the shelter of forest and relatively narrow stretches of grassland or pastoral land seem sufficient to prevent ready exchange between populations. It is interesting to find however that many of the forest floor spiders will persist amongst fallen logs when forest is cleared and will also be found beyond the confines of the forest when an abundant cover of loose-lying rocks are available. A recent survey of the spiders inhabiting leaf litter in contiguous areas of virgin and cut-over native beech (*Nothofagus*) forest and planted pinus forest in the Westland region of the South Island shows clearly the inability of these spiders to colonize this new forest habitat. Of over seventy species recorded from the native forests only 10% were recorded from long established stands of pinus and the population density of most of these species was so low that it is doubtful that they could maintain a viable population without continued repopulation from the contiguous native forest.

## ACKNOWLEDGMENTS

We wish to express our thanks to the numerous individuals who have assisted in the collection and the loan of material studied in this and earlier papers and to the continued interest and most valuable comment and criticism from colleagues in other countries.

## FAMILY GROUPING

While we do not consider that we are able at the present time to present a fully revised system for the classification of this group of spiders which would provide the stability so obviously needed we have listed below the placement within superfamilies of those families we have studied. It is probable that the Miturgidae and Dolomedidae will also be included in the Amaurobioidea after further study.

### Superfamily Dictynoidea

Dictynidae  
Hahniidae  
Desidae  
Cybaeidae  
Argyronetidae  
Amaurobioiidae  
Anyphaenidae

### Superfamily Amaurobioidea

Amaurobiidae  
Agelenidae  
Stiphidiidae  
Amphinectidae  
Neolanidae  
Psechridae  
Ctenidae  
Cycloctenidae

<sup>1</sup>The research work in this paper has been supported by grants from the Scientific Distribution Committee, Golden Kiwi Lottery Fund, National Institutes of Health, Education and Welfare, U.S.A., and the Nuffield Foundation, Great Britain. Some of the material studied was obtained from a pitfall trapping programme financed through a grant to C. L. Wilton from the Hutton Fund, Royal Society of New Zealand. Publication costs have been supported in part by a grant from the Scientific Distribution Committee, Golden Kiwi Lottery Fund.

## SYSTEMATIC METHODS AND INTERPRETATION

We feel that some comment is needed on the method by which the conclusions on the classification of the spiders covered in this and the previous volume were reached. At the beginning of the study we were faced with a huge collection of rather similar spiders encompassing a large number of species the bulk of which were undescribed. It was decided first to separate out and describe the species and on completion of this task to group the species into genera before considering the problem of the higher taxa. This is the reverse of the approach normally used when recording new species but was necessary because at a very early stage we realized that the validity of the taxa generally accepted at the family level were unsatisfactory in that most were polyphyletic and that most of the generic groupings could be new. The main reasons for this conclusion were related to the tracheal system and the cribellate question. At a very early stage it was realised that the presence or absence of a cribellum was often of no more than generic significance and in some instances (*Mahura*, *Tararua* etc.) could not even be used for limiting a genus. It was obvious that the groups we were dealing with were evolutionarily active and that the loss of the cribellum was a process taking place at the present time. Secondly an extensive investigation of the internal structure of these spiders showed that the two basic forms of trachea, branched and simple, could be correlated with other characters such as the form of male palp, suggesting that there was a very early splitting of these spiders into two groups which we have separated into two superfamilies we have named Dictynoidea and Amaurobioidea.

It was also evident that throughout these two superfamilies the cribellate members tended to be conservative structurally while the loss of the cribellum, which was usually associated with a change from the passive use of a snare to active pursuit of prey, could lead to rapid radiation of the ecribellate derivatives which then could exhibit quite radical structural changes away from the ancestral form. Such changes are particularly striking in the modifications of the eyes. The alignment of the eyes away from the basic two straight rows along with the enlargement of the posterior and sometimes the anterior lateral eyes is evidently advantageous to a vagrant hunting spider in improving perception of movement over a wider section of the surrounding area. In both superfamilies spiders are found with the eyes modified in this way. Modifications are commonly found in the Desidae (Myroninae, Toxopinae), Dictynoidea and are relatively constant in the Ctenidae and Cycloctenidae two families which we consider belong in the Amaurobioidea.

Similar modifications have become stabilised in the Lycosidae and Pisauridae both of which have probably been derived from Amaurobioid stock. The somewhat similar movement of the eyes in the Salticidae is coupled with the development of

the AME into very efficient visual organs and is not directly comparable although it might possibly be considered that these spiders are distantly related to the Dictynoidea.

The difficulties involved in evaluating all of these trends not only in eyes but also chelicerae, legs, and other appendages the structure of the female genitalia and the sclerites of the male palp as well as internal structure are self evident. Initially the classical family limitations which have generally been accepted in the past were ignored and parameters were adopted into which the spiders studied could be fitted. The final requirement was then to consider the relationships of these taxa with the family limits previously established. While we are convinced that the results of this study more clearly presents the phylogeny of this group of spiders than previous classifications we freely admit that the limitations of the taxa finally adopted and the general lack of key characters brings a certain vagueness to the classification of the group which we feel will only be eliminated after the fauna of other countries becomes better known. We have not attempted at this stage to establish taxa between genus and family, not because we feel that such subdivisions are not warranted, but because we consider a much deeper knowledge of the fauna of other countries, including presently undescribed species would be needed if a worthwhile contribution were to be made. It is interesting to note that Lehtinen (1967) in his revision of the same group of spiders came to almost identical conclusions. "I am inclined to confess that the limitations of taxa at the family group level in the Amaurobioides is more a matter of opinion at the family group level than in any other group treated in this paper. . . . Thus the adaptive radiation of the Amaurobioides is still in rapid progress, and many of its subdivisions may be fairly young".

## LEGS

Although the spination of legs can provide much useful data for diagnostic purposes discretion in their use must be exercised as not all spines are of equal diagnostic value and aberrations occur even with those spines which appear to be important.

We have taken the figure of a leg (fig. 2) and drawn in it what is probably the basic pattern of spination. Variation from this pattern is usually in the reduction of the number of spines and this reduction appears to follow set patterns which will be discussed more fully when considering each segment. Sometimes additional spines are present and the genus *Ischalea* L. Koch is an exceptional example of this. *I. spinipes* L. Koch is very aptly named. Spines are sometimes reduced to bristles, or more rarely to very small stout spines, especially on the patellae and dorsal surfaces of the tibiae.

It is usual to regard the lateral surfaces of the legs as being respectively prolateral and retrolateral thus implying that the longitudinal axis

Fig. 1 *Poaka graminicola* n.sp. Prolateral view of the first leg showing spination. Figs. 2-5 Basic spination of first pair of legs in the Amaurobioidea (diagrams modified from Chamberlain, 1940). Fig. 2 Prolateral surface. Fig. 3 Retrolateral. Fig. 4 Ventral. Fig. 5 Dorsal. Fig. 6 Plumose hair from leg of *Aorangia*. Fig. 7 Ventro-distal surface metatarsus of leg 3 showing preening combs, *Amphinecta*. Fig. 8 Distal retrolateral surface of metatarsus and proximal surface of tarsus of *Otira indura* showing preening comb and double row of tarsal trichobothria. Fig. 9 Distal surface of tarsus of *Otira indura* showing long distal trichobothrium and tarsal rod.

of the legs is set at right angles to that of the body. The distribution of the trichobothria and lyriform organs substantiate this view of orientation. However some modifications of spination suggest that it may be convenient in some circumstances to regard the legs as having a different orientation. The prograde spider with the anterior legs directed forwards and the posterior pair backwards make the prolateral surfaces of the former and the retrolateral surfaces of the latter the inner surfaces and the retrolateral surfaces of the anterior pairs and the prolateral surfaces of the posterior pairs the outer surfaces. This view has significance with regard to some modifications to femoral and ventral tibial spines. This also applies to preening combs.

The posterior legs are more conservative in spination, especially the third pair, and the greatest modification occurs on the first leg. The second pair tends to resemble the first pair but with a lesser degree of modification. When there is little difference between all the legs with a minimum of reduction or accretion then the spider has a primitive spination. This primitive condi-

tion is much more evident in cribellate than in ecribellate species.

## Femur

The spines are in three rows on the dorsal surface, a mid row of three and a row of two spines on each side. The usual order of reduction is for the basal spines of the lateral rows to go first, then the distal one of the mid row and the remaining lateral spines next. The persistent spine is the basal one of the mid row which, when all other femoral spines have disappeared, will be found at least on the posterior legs (*Huka*). These spines however vary considerably. In addition to the above spines a prominent spine is often present on the distal half of the prolateral surface of the first leg. We have termed this spine the prolateral spine of the first femur. Most cribellate spiders of the group under discussion possess it but it is often lacking in the ecribellate species. Occasionally there is a similarly sited spine on the other legs, less prominent, between the two spines of the pro-dorsal row.

Fig. 1 shows the spination of the anterior surface of a first leg of *Poaka graminicola* n.sp. The spines on the femur which are directed downwards and almost ventral in position, together with the heavy ventral spination of the tibia and metatarsus give a pattern which is quite different from the other spiders which are the subject of this work. It is, however, very similar to that found in the genera *Acanthoctenus* Keyserling and *Zora* C. L. Koch.

#### Patella

The full complement is 1.1 dorsal spines. These may reduce to bristles on all legs but the pattern which occurs most frequently is for the spines to be reduced on the anterior legs and be present on the posterior legs.

#### Tibia

The dorsal surface has two spines, one proximal and one distal. Very rarely there is also a median spine. These spines are often reduced to bristles especially on the anterior pairs of legs and there appears to be some correlation in this respect with the patellar spines. The proximal spine is posterior from the dorsal mid line, often erect, while the distal spine is on the mid line and recumbent. The basic pattern in the lateral surfaces appears to be a proximal, a median and a distal spine. These spines seem to vary considerably and their systematic use of little value. In *Huara*, *Mamoea* and related genera there is a tendency for them to move and become incorporated with the ventral system. The ventral spines are reduced from the basic 2.2.2. (proximal, median and distal) pattern either by losing the distal pair (*Huara*, *Amphinecta* etc.) or by retaining the distal pair and losing spines from the other pairs. These spines seem to be just as unstable on the posterior pairs of legs as on the anterior pairs.

#### Metatarsus

The proximal, median and distal siting of spines also obtains on the metatarsus. Reduction frequently occurs on the anterior legs but the number of proximal and median lateral spines on the posterior legs is often doubled. The distal spines are arranged in a whorl consisting of a mid-ventral and two lateral spines on each side. On the first pair of legs occurs less frequently and often only three ventrally situated spines or even more so (*Huara-Mamoea* group) by losing the mid-ventral spine also. Reduction in the whorl on the second pair of legs occurs less frequently and often only the dorso-lateral spine on the retrosurface is lost.

#### Tarsus

Very small spines occur on the ventral surface of the distal half of this segment of the posterior legs. These spines are not obvious and only in the genus *Mala* are they of any consequence.

#### Preening combs

(Figs. 7, 8). These combs are to be found in *Orepukia*, *Pakeha* group, *Amphinecta*, *Paramamoea* and *Holomamoea*. They are found latero-ventrally on the metatarsus distally. They are more strongly developed on the third legs. Those on the fourth legs have the retro-lateral comb with a greater number of setae and on the second legs this comb is often reduced to no more than two setae.

#### Scopulae

*Huara* and *Mamoea* have scopulae on the ventral surfaces of the tarsi and metatarsi while *Paramamoea* has the scopulae restricted to the metatarsi. Unlike some of the spiders described in the Dictynoidea none of the spiders dealt with in this part possess three claws and claw tufts composed of tenent hairs.

#### Trichobothria

Basically the pattern of the distribution of the trichobothria for the spiders under discussion is for the tibia to have two rows on the dorsal surface. The retro-row usually extends further along the segment than the pro-row. Very frequently there are additional small trichobothria basally. This pattern is also present on the palps. The metatarsus has a single row. The distal trichobothrium of this row is often very long and this condition seems to be a feature of the forest floor fauna irrespective of the size of the animal. This trichobothrium is also often sharply bent backwards at a point about two-thirds from the base. There does not seem to be any phylogenetic significance as these two latter conditions occur among different groups. The *Pakeha* group of genera have an additional trichobothrium posterior from the row about level with the penultimate trichobothrium of the row. The tarsal trichobothria are usually in a single row. However in the *Pakeha* group and *Haurokoa* the trichobothria become alternately staggered and form a double row. On the palps, the tarsal segment of the female and cymbium of the male, do not always have trichobothria. They appear to be lacking on those spiders we have placed in the Agelenidae and Neolanidae and the genera *Aorangia* and *Haurokoa*.

#### Tarsal organ

A tarsal organ is usually found on all the tarsi of the legs and palps. They may be always present but at times become very small and very difficult to see. However there are two modifications which appear to have generic importance. In most cases the tarsal organ is distal to all trichobothria but on the legs of the genera *Oramiella*, *Akatorea*, *Rangitata*, and *Huara* there is at least one trichobothrium more distal in position than the tarsal organ.

#### Tarsal Rod

The structure we have named the 'tarsal rod' is unlike any previously found in spiders. (Fig 9). It appears as a single erect translucent rod on each pedal tarsus in the amaurobiid genus *Otira*. The tarsal rod rises up from a circular pale area on the dorsal surface of the tarsus and is positioned from about the midlength to two-thirds of the segment. The structure is at present being examined with by scanning microscope and from sections. From ordinary microscope examination it appears to consist of a thin sheath which arises from the integument within which is a solid although gelatinous looking rod. *Otira* is not otherwise unusual in that it appears to be closely related to the smaller species of *Pakeha* which have typical tarsal organs. Tarsal organs are lacking in *Otira*.

#### THE CRIBELLATE PROBLEM

All of the families treated in the present volume, have both cribellate and ecribellate genera. The evidence which is now becoming available suggests strongly that all of the araneomorph spiders, both haplogyne and entelegyne, have passed through a cribellate phase and that whereas some of fairly well defined lines represented by such families as the Salticidae, Lycosidae and Oonopidae etc. have been long fixed in the

ecribellate state members of many other taxa are still losing this organ. It is also clear that the loss of these structures is often correlated with a decrease in the dependance on a snare to catch prey. A clear example of this trend is shown with the recent discovery of a cribellate Gradungulid inhabiting caves in Australia. This spider, as yet undescribed, constructs a large snare whereas the ecribellate members of the family are terrestrial hunting spiders which do not even construct a retreat.

A number of instances were listed in the previous volume of this work (Forster, 1970) of related cribellate-ecribellate genera and in one genus *Goyenia* both cribellate and ecribellate species were described. In the present volume a number of similar instances of relationship at a generic level are described but also within the large genus *Mahura* there are species pairs (*spinosa-spinosoides scuta-southgatei*) which differ mainly in the presence or absence of the cribellum and calamistrum. *Mahura* is of considerable interest in that as a group these spiders are only weakly cribellate. The spinning fields of the cribellate species is usually small and the calamistrum consists of only a few hairs and these are often long and slender, very different from the typical apically curved and rigid bristles found in most cribellates. *Mahura* is closely related to the ecribellate genus *Orepukia*.

THE family Agelenidae has over the years been a convenient depository for those three-clawed generalized ecribellate spiders which do not exhibit any striking derived characters. The two most recent revisions (Lehtinen, 1967, Roth, 1967) differ mainly in the restriction of the family by Lehtinen to those spiders with a divided colulus and with the posterior pair of spinnerets more or less lengthened. While this limitation does provide a nicely circumscribed and almost certainly monophyletic group of mainly Northern Hemisphere spiders it raises major problems when the spiders of the Australasian region are considered. On the basis of the reproductive organs, the sometimes divided colulus and other characters the New Zealand ecribellate genus *Orepukia* seems to be a typical agelenid, but the posterior pair of spinnerets are not lengthened. This genus is however undoubtedly closely related to *Mahura* in which the derived ecribellate species do not have a double colulus. Furthermore if we accept *Orepukia* as an agelenid and also accept its relationship with *Mahura* we are led through related cribellates to such genera as *Porotaka*, *Ahua* and the *Neoramia* group of genera. Again the ecribellates which have been derived from these genera do not possess a divided colulus. The tendency with all these spiders is for the cribellum to be reduced to a conical structure before losing the spinning fields. The colulus is then a more or less triangular structure, and the hairs are not separated into two bunches.

Our interpretation of the limits of this family approaches the classical view by including spiders with both forms of colulus which may or may not have the posterior spinnerets elongate. We have also added a further dimension by including cribellate genera.

The result is of course by no means satisfactory in that it is at least to some degree polyphyletic and can be considered to be perpetuating the practice of using this family as a 'dump' for those generalized three clawed spiders which do not possess sufficiently distinctive derived characters to warrant their location in another family. We have however, by relocating a number of genera which had been placed in this family earlier, along with many described in this present paper which would previously have been placed in the

Agelenidae, clarified the phylogeny of this group to some extent.

The diagnosis we have used for this family is as follows:—

Cribellate and ecribellate spiders Eyes in two transverse rows. Median apophysis of the male palp of the basic weakly sclerotized, apically hooked form or derived forms, but not heavily sclerotized and flattened. (c.f. Amaurobiidae) Embolus usually spiniform. Conductor usually well developed and often T-shaped. Cymbium and tarsus of female palp, without trichobothria. Legs with basic spination. Trichobothria usually numerous and in a double row on the tibiae and a single row on metatarsi and tarsi. Three claws, without claw tufts or scopulae. Plumose hairs sometimes present. Chelicerae with boss. Teeth on both margins. Internal genitalia strongly receptaculate. Cribellum, when present, divided. Colulus paired or single. Calamistrum in a single row. Tracheal system consisting of up to four simple tubes limited to the abdomen.

The only single character which sets this family apart is the absence of trichobothria on the cymbium of the male palp. This is a character which is completely ignored by all workers and so we are not certain how much emphasis should be placed on it.

KEY TO THE NEW ZEALAND GENERA OF THE  
FAMILY AGELENIDAE

1. Plumose hairs present 2  
Plumose hairs absent 3
2. Posterior pair of spinnerets much longer than anterior pair. Chelicerae with four teeth on the retromargin. Colulus much wider than long, with two patches of hair  
**Tegenaria** Latr.  
Anterior and posterior pairs of spinnerets more or less equal in length. Chelicerae with two teeth on the retromargin. Colulus with hairs evenly spread  
**Neorepukia** n.gen.
3. Very small (2 mm or less in body length). Lacking pigment. Usually cream in colour 4  
Much larger or if small with a definite colour pattern 5

11

12

Fig. 11 Colulus of *Orepukia similis* n.sp. Fig. 12 Colulus of *Tegenaria domestica*.

4. First two parts of legs without spines. Cribellate  
**Huka** n.gen.  
All legs with spines. Cribellate  
**Tuapoka** n.gen.
  5. Colulus much wider than long with hairs in two patches. Ecribellate  
**Orepukia** n.gen.  
Usually cribellate but if ecribellate then colulus compact, with hairs evenly spread 6
  6. Eyegroup compact, occupying one half of the width of the head. AME small, situated within a ring formed by remaining eyes. Ecribellate  
**Paramyro** n.gen.  
Eyes not arranged as above and occupying more than one half of the width of the head 7
  7. Tarsal trichobothria extending beyond the tarsal organ. Cribellate  
**Oramiella** n.gen.  
Tarsal organ distal to the trichobothria 8
  8. Small, body length usually much less than 5 mm 9  
Medium sized to large. Body length usually much greater than 5 mm 12
  9. Conductor of male palp large and T-shaped with the embolus resting along the distal margin of the T  
Conductor well developed but not T-shaped 10 11
  10. Epigynum strongly sclerotized, usually with a prominent median plate. Cribellum present or absent  
**Mahura** n.gen.  
Epigynum weakly sclerotized, with a small transverse plate along the posterior margin. Cribellum present or absent  
**Porotaka** n.gen.
  11. Epigynum with paired spines along the posterior margin. Only distal portion of embolus resting on conductor. Cribellum present or absent  
**Tararua** n.gen.  
Epigynum without spines but with subtriangular plate on posterior margin. Most of embolus resting along the conductor. Cribellate  
**Ahua** n.gen.
  12. Embolus flattened and twisted distally. Ducts of internal genitalia well developed. Probably restricted in distribution to the spray zone along sea beaches  
**Oramia** Forster  
Embolus slender and spiniform. Ducts of internal genitalia short. Distribution wide and not restricted in habitat  
**Neoramia** n.gen.
- Tegenaria** P. A. Latreille 1804
- Cephalic portion of the carapace narrow. Eight eyes in two rows which are straight or gently procurved. Eyes

Fig. 13 *Tegenaria domestica*, male

Fig. 14 Web of *Tegenaria domestica*.

subequal in size with the AME usually slightly smaller than the lateral eyes. Lateral eyes slightly separated. Posterior spinnerets with the apical segment as long as the basal segment. Colulus relatively broad with two clumps of hairs (Fig. 12). Legs long, with plumose hairs. Spines long and aculeate. The femur of the first pair of legs has a prolateral spine and a similarly sited spine is also present on the second pair. The mid-dorsal distal spine is lacking on all femora. Tibial dorsal spines are present on the third and fourth pairs of legs but lacking on the first and second. The ventral surface of the tibia of the first pair of legs has at least one distal spine. The distal whorl of spines on the metatarsus of the first pair of legs is reduced to three spines, the prolateral and retrolateral dorsal spines missing. Legs lacking combs and scopulae. Tarsal organ distal to trichobothria on legs. Palpal tarsus without trichobothria. Cymbium of male palp pointed distally and projecting well beyond the bulb. Embolus spiniform. Conductor a prominent T-shaped structure. Median apophysis simple. Epigynum small.

Type species *Araneus domesticus* Clerk.

This genus is well known in the Northern Hemisphere but does not occur naturally in this country. Two species are recorded below but the one commonly found is the cosmopolitan *Tegenaria domestica*. These fast moving spiders are easily recognised in New Zealand by their slender legs and the general hairiness which is quite unlike the bulk of our native forms. They are usually found in and around houses. The

elongate distal segment of the posterior pair of spinnerets is an immediate diagnostic character in this country and is otherwise found only in *Aorangia*. The web is a distinctive sheetweb, often constructed in corners (Fig. 14) leading to a retreat in which the spider normally remains. The only similar web commonly seen in New Zealand is that of *Cambridgea* (Fig. 396) but *Tegenaria* runs on the upper surface of the sheet while *Cambridgea* uses the under surface.

| 2    | 4.08     | 1.36    | 3.74  | 4.08       | 2.21   | 15.47 |
| 3    | 3.40     | 1.02    | 3.40  | 4.25       | 1.87   | 13.94 |
| 4    | 5.10     | 1.19    | 4.59  | 5.27       | 2.04   | 18.19 |
| Palp | 2.04     | 0.51    | 0.68  |            | 0.85   | 4.08  |

**Colour** Cephalothorax and legs uniform reddish brown. Abdomen grey, without markings. Some specimens are uniform pale yellow.

**Carapace** The head region is narrow, only slightly more than half of the width of the thorax. The thoracic

groove is shallow and distinct only on the lateral surfaces. The fovea is deep and the surface on each side is slightly humped.

**Eyes** From above the anterior row is slightly recurved and the posterior row slightly procurved. From in front the anterior row is straight and the posterior row is procurved. The ratio of the AME.ALE.PME.PLE. = 4.5.4.5. The AME are separated from each other and the ALE by a distance equal to 1/4 of the diameter of an AME. Lateral eyes contiguous. The PME are separated from each other by 3/4 and from the PLE by 2/4 of the diameter of an AME. The median ocular quadrangle is wider behind than in front in the ratio of 11.9 and wider behind than long in the ratio of 11.10. The height of the clypeus is equal to the diameter of an AME.

**Sternum** Scutiform, longer than wide in the ratio of 5.4. Anterior margin straight, lateral margins undulate. The posterior projection is sharp and separates coxae 4 by a distance equal to 7/20 of the width of a coxa.

**Maxillae** Lateral margins sub-parallel, anterior margin oblique. Twice as long as wide.

**Labium** Notched at the base. Lateral margins gently curved. Anterior margin straight. Wider than long in the ratio of 15.13.

**Chelicerae** Lateral boss present. Retromargin with four teeth, promargin with three teeth. A definite carina extends from the proximal tooth to the base of the chelicera.

**Palp** (Figs. 19,20) The embolus is stout and the conductor is a stout plate hollowed in the ventral surface.

**Legs** 4123. Clothed with numerous strongly plumose hairs, and longer smooth hairs. The spines are grouped mainly on the ventral surfaces of the tibiae and metatarsi. First leg. Tibia, v.2.2.2. Metatarsus, v.2.2.1. Second leg. Tibia, v.2.1.1. Metatarsus, v.2.2.1. Third leg. Tibia, v.2.0.2. Metatarsus, v.2.2.1. Fourth leg. Tibia, v.2.2.2. Metatarsus, v.1.1.2.1. Trichobothria are numerous. Tibia, 1.2.1.1.1. Metatarsus, 3. Tarsus, 5. Superior claws with from 9-10 teeth. Inferior claw with 4 teeth.

This is a cosmopolitan species which has been established in New Zealand for many years. It is often found in houses and sheds. Rarely seen in open country and never in forest. Distributed throughout New Zealand but the number of specimens in collections is small because specimens are rarely preserved.

Fig. 22 *Orepukia poppelwelli* n.sp. with eggsac.

#### Orepukia n.gen.

Medium sized (body length 6-7.5 mm) ecribellate spiders. The eye-group is compact and occupies approximately one half of the width of the head. Eight eyes in two rows. Anterior row straight and posterior row slightly procurved. AME approximately one half of the size of the ALE. ALE.PME.PLE subequal. Lateral eyes contiguous or nearly so. Chelicerae vertical, with boss. Retromargin with two teeth. Promargin with two normal teeth and usually a group of small even sized teeth. Labium notched at the base. Wider than long or as wide as long. Legs 4123, without plumose hairs. The trochanters are notched but the anterior pairs only very slightly. Femoral spines long and curved. Prolateral spine of the femur of the first pair of legs lacking. Femoral spines usually d.1.1.1. p.r.0.1. The tibial dorsal spines strong on the third and fourth pairs of legs but reduced to bristles on the first and second pairs. Tibia of the first pair of legs with paired ventral spines, one pair being distal in position. The distal metatarsal whorl of spines on the first pair of legs may reduce by the loss of the dorsolateral spines or that spine on the retrolateral surface only. Preening combs are present on the metatarsi of the second, third and fourth pairs of legs. The tarsal organ is distal to the trichobothria. Superior claws similar, strongly pectinate. Inferior claw with from 2-4 teeth. Scopulae, claw tufts and tenent hairs lacking. Trichobothria in a double row on tibia and a single row on metatarsi and tarsi. Claw of female palp with teeth. Trichobothria in a double row on the tibia but absent from the tarsus. Tibia of male palp with retrolateral processes. Embolus slender, spiniform, evenly curved, originating from the posterior prolateral margin. Distal portion of embolus supported by the apical branch of a large T-shaped conductor which originated from near the

base of the embolus. Median apophysis simple. Type species *Orepukia sorenseni* n.sp.

This widespread endemic genus has been recorded from all parts of the country except for the northern half of the North Island. They are found mainly on the forest floor where they construct a rather formless web under fallen logs and debris. Several species have been found living in crevices in banks and cliff faces. As they are commonly collected from pitfall traps set in grassland the spiders must also at times live in relatively open country. *O. poppelwelli* is often found in gardens in Dunedin where it constructs its web under litter in undisturbed areas. The majority of the species recorded are from the South Island. They are only rarely found in the North Island and do not seem to extend further north than Egmont.

#### FEMALE

##### Measurements

|      | Carapace | length 4.20 | width 2.80 |            |
|------|----------|-------------|------------|------------|
|      | Abdomen  | length 4.00 | width 2.10 |            |
| Leg  | Femur    | Patella     | Tibia      | Metatarsus |
| 1    | 3.10     | 1.30        | 2.70       | 2.35       |
| 2    | 2.90     | 1.30        | 2.25       | 2.25       |
| 3    | 2.75     | 1.25        | 2.00       | 2.35       |
| 4    | 3.50     | 1.35        | 2.80       | 3.10       |
| Palp | 1.70     | 0.70        | 0.80       | 1.50       |
|      |          |             |            | Tarsus     |
|      |          |             |            | 1.45       |
|      |          |             |            | 1.40       |
|      |          |             |            | 1.25       |
|      |          |             |            | 1.50       |
|      |          |             |            | 1.25       |
|      |          |             |            | 4.45       |

**Colour** The carapace pattern is shown in Fig. 26. The legs have dark bands. The abdomen is shaded black with a pale area on each antero-lateral surface. There is a pair of pale spots on the anterior dorsal surface followed by three pairs of oblique bars or chevrons. Ventral surface pale with the spinnerets surrounded by dark shading.

**Eyes** The group occupies about half of the width of the head. From in front the anterior row is slightly procurved and the posterior row procurved. From above the anterior row is almost straight and the posterior row procurved. Ratio of AME.ALE.PME.PLE = 4.8.8.8. AME separated from each other by a distance equal  $3/4$  and from the ALE  $2/4$  of the diameter of an AME. M.O.Q. wider behind than in front in the ratio of 21.11 and wider behind than long in the ratio of 21.19. Height of clypeus equal to  $15/4$  of the diameter of an AME.

**Sternum, maxillae, labium and chelicera** are typical.

**Palp** Spines typical. Trichobothria, Tibia, 1.2.2.2.2.2.2. Tarsus, 0. Tarsal organ very small.

|              | Carapace | length  | width |            |        |       |
|              | Abdomen  | length  | width |            |        |       |
| Leg          | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1            | 2.50     | 1.05    | 2.20  | 2.20       | 1.35   | 9.30  |
| 2            | 2.35     | 1.00    | 1.85  | 2.00       | 1.25   | 8.45  |
| 3            | 2.25     | 1.00    | 1.60  | 2.00       | 1.10   | 7.95  |
| 4            | 2.70     | 1.05    | 2.20  | 2.60       | 1.35   | 9.90  |
| Palp         | 1.60     | 0.60    | 0.50  |            | 1.10   | 3.80  |

Similar in appearance to the female.

**Eyes** The ratio of AME.ALE.PME.PLE = 3.7.7.7. The AME are separated from each other by a distance equal to their diameter and 2/3 of that distance from the ALE. The PME are separated from each other and from the PLE by the diameter of an AME. MOQ wider behind than in front in the ratio of 17.9 and wider behind than long in the ratio of 17.15. Height of the clypeus equal to 10/3 of the diameter of an AME.

**Palp** The bulb and tibial processes are shown in Figs. 31, 32.

**Legs** Spines First leg. Femur, d.1.1.1. p.r.0.1. Tibia, v.2.2.2. p.1.1.1. r.0.1.1. d.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2.

**Types** Holotype female and allotype male. Southland. In crevices on a cliff near the mouth of the Rowallan Stream, Te Wae Wae Bay, 25.xi.1970, R. R. Forster, C. L. Wilton (Otago Museum).

**Record** Southland. Same locality as types, 11.iii.1970, C.L.W.

#### *Orepukia tonga* n.sp.

Figs. 35-36

| FEMALE       |          |         |       |            |        |       |
|--------------|----------|---------|-------|------------|--------|-------|

|              | Carapace | length  | width |            |        |       |
|              | Abdomen  | length  | width |            |        |       |
| Leg          | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1            | 2.30     | 1.00    | 1.98  | 1.75       | 1.08   | 8.11  |
| 2            | 2.13     | 0.90    | 1.65  | 1.55       | 1.00   | 7.23  |
| 3            | 2.00     | 0.95    | 1.40  | 1.70       | 0.93   | 6.98  |
| 4            | 2.50     | 1.00    | 2.13  | 2.25       | 1.08   | 8.96  |
| Palp         | 1.13     | 0.50    | 0.58  |            | 1.00   | 3.21  |

**Colour** The head region of the carapace, the median and lateral surfaces of the thoracic region are reddish brown. Legs orange brown darkening distally. Sternum and chelicerae reddish brown. Abdomen brown but covered with black reticulate markings.

**Eyes** The eyegroup occupies 3/5 of the width of the head. From above and in front the anterior row is straight and the posterior row is slightly procurved. Ratio of AME.ALE.PME.PLE = 8.15.13.15. AME separated from each other by a distance equal to 6/8 and from the ALE by 3/8 of the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other and from the PLE by 10/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 12.8 and wider behind than long in the ratio of 12.11. Height of the clypeus equal to 20/8 of the diameter of an AME.

**Chelicerae** Chelicerae equal to one third of the length of the carapace. Small boss present. Both pro and retromargins with two teeth.

**Palp** Spines Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, p.1.2. d.1.0. Seven trichobothria on the tibia arranged 2.2.2.1. Claw with 5 small teeth.

**Legs** Spines: First leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.0.1. Tibia, v.2.2.2. p.0.1.1. Metatarsus v.2.2.1. p.0.1.2. r.0.0.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.0.1. Tibia, v.2.2.2. p.1.1.1. Metatarsus v.2.2.1. p.1.1.2. r.0.1.2. d.0.1.1. Trichobothria: Tibia, 2.2.2.1.1. Metatarsus, 5. Tarsus, 3. Superior claws with from 9-10 teeth. Inferior claw with two teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 35, 36. Anterior pair of spinnerets slightly larger than the posterior pair.

**Type** Holotype female. Chateau Tongariro, 20.xii.1948, R. R. Forster (Otago Museum).

#### *Orepukia egmontensis* n.sp.

Figs. 37-38

| FEMALE       |          |         |       |            |        |       |
|--------------|----------|---------|-------|------------|--------|-------|
| Measurements |          |         |       |            |        |       |
|              | Carapace | length  | width |            |        |       |
|              | Abdomen  | length  | width |            |        |       |
| Leg          | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1            | 1.80     | 0.75    | 1.50  | 1.40       | 0.85   | 6.30  |
| 2            | 1.60     | 0.70    | 1.25  | 1.20       | 0.80   | 5.55  |
| 3            | 1.50     | 0.65    | 1.05  | 1.30       | 0.70   | 5.20  |
| 4            | 1.95     | 0.75    | 1.55  | 1.65       | 0.90   | 6.80  |
| Palp         | 0.90     | 0.40    | 0.45  |            | 0.80   | 2.55  |

**Colour** Pattern of carapace clearly defined. There is a pale narrow band extending from a point between the PME to the median fovea. The legs have bands. The pro-lateral surfaces on each side of the abdomen are pale and the median dorsal pattern is composed of two pairs of oblique bars followed by two chevrons.

**Eyes** The group occupies 3/5 of the width of the head. The curvature of the rows is typical. Ratio of AME.ALE.PME.PLE = 3.5.5.5. AME separated from each other by a distance equal to 2/3 and from the ALE by 1/3 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/3 and from the PLE by 3/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 14.8 and wider behind than long in the ratio of 14.13. Height of clypeus equal to 8/3 of the diameter of an AME.

**Palp** Spines: Femur, d.1.1.1. p.1.3.0. Patella, 1.1. Tibia, d.1.1. p.1.2. Trichobothria: Tibia, 2.2.2.2. Claw with five teeth.

**Legs** Spines: First leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. bristles 2.1. p.0.1.1. r.0.0.1. Trichobothria. Tibia, pro-row, 5, retro-row, 5. Metatarsus and tarsus, 5. Sub-distal tarsal organ. Superior claws with nine teeth and the inferior claw with three teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 37, 38.

**Type** Holotype female. Taranaki. Mt Egmont, above Stratford House, 3,505 ft, 21.iii.1969, R. R. Forster, C. L. Wilton (Otago Museum).

**Record** Same locality as holotype, 22.ii.1967, C.L.W.

##### Measurements

|      |          |             |            |            |        |       |
|------|----------|-------------|------------|------------|--------|-------|
|      | Carapace | length 3.25 | width 2.40 |            |        |       |
|      | Abdomen  | length 3.25 | width 2.19 |            |        |       |
| Leg  | Femur    | Patella     | Tibia      | Metatarsus | Tarsus | Total |
| 1    | 2.75     | 1.20        | 2.45       | 2.35       | 1.50   | 10.25 |
| 2    | 2.30     | 1.15        | 2.00       | 2.10       | 1.20   | 8.75  |
| 3    | 2.20     | 0.85        | 1.55       | 2.00       | 1.15   | 7.75  |
| 4    | 2.80     | 1.00        | 2.40       | 2.65       | 1.35   | 10.20 |
| Palp | 1.60     | 0.70        | 0.70       |            | 1.15   | 4.15  |

**Colour** The carapace is pale cream with pale yellow brown shading. The medium region of the cervical groove on each side is shaded black (Fig. 23). The legs are generally pale without black bands except on the ventral surfaces of the femora. The abdomen is pale but well flecked with black. The anterior dorsal surface has the appearance of being sclerotized but the integument yields to slight pressure.

**Eyes** The group occupies 7/13 of the width of the head. Curvature typical. Ratio of AME.ALE.PME.PLE

= 3.6.5.6. AME separated from each other and from the ALE by a distance equal to 2/3 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 5/3 and from the PLE by 4/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 15.8 and wider behind than long in the ratio of 15.13. Height of clypeus equal to 12/3 of the diameter of an AME.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Tibia, a group of 4 to 5 on the inner surface. Trichobothria. Tibia, a pro-row of 1.1.1.1.1. and retro 1.1.1.1. The bulb and the tibial processes are shown in Figs. 46, 47.

**Legs** Spines. First leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. bristles. Tibia, v.2.2.2. p.1.1.1. r.0. d.1.1. bristles. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.1. Second leg. Metatarsus, v.2.2. and distal subwhorl of 5, p.1.2. r.0.1. Trichobothria. First leg. Tibia, pro 5, retro 6. Metatarsus and tarsus, 6. Superior claws with 10, inferior claw 4 teeth.

**MALE**

**Measurements**

| Leg | Carapace |         | length 4.00 |            | width 3.00 |  | Total |
|-----|----------|---------|-------------|------------|------------|--|-------|
|     | Femur    | Patella | length 2.80 | width 2.00 |            |  |       |
| 1   | 3.20     | 1.24    | 2.60        | 2.68       | 1.84       |  | 11.56 |
| 2   | 2.80     | 1.24    | 2.00        | 2.34       | 1.44       |  | 9.82  |
| 3   | 2.60     | 1.16    | 1.84        | 2.24       | 1.36       |  | 9.20  |
| 4   | 3.20     | 1.24    | 2.76        | 3.08       | 1.44       |  | 11.72 |

**Colour** Carapace and abdomen as in Figs. 22, 24. Chelicerae reddish brown. Sternum heavily shaded with black and with a median triangular dark patch. Legs yellow brown with dark brown bands.

**Eyes** The eyegroup occupies one half of the width of the head. From above both rows appear straight but from in front the anterior row is straight and the posterior row is slightly procurved. Ratio of AME.ALE. PME.PLE = 10.18.15.18. AME separated from each other and from the ALE by a distance equal to 5/10 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 13/10 and from the ALE by 10/10 of the diameter of an AME. MOQ wider behind than in front in the ratio of 43.25 and wider behind than long in the ratio of 43.42. Height of clypeus equal to twice the diameter of an AME.

**Chelicerae** Chelicerae equal to one third of the length of the carapace. Retromargin with 2 teeth. Promargin with 9 minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** As shown in Figs. 50, 51.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.2.2. p.1.1.1. r.0.0.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.2.2. p.1.1.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Trichobothria. Tibia, 1.2.2.2.1. Metatarsus, 6. Tarsus, 7. Superior claws with 8 teeth. Inferior claws with 4 teeth.

**Abdomen** The posterior pair of spinnerets are slightly smaller than the anterior pair.

**FEMALE**

**Measurements**

| Leg  | Carapace |         | length 4.12 |            | width 3.02 |  | Total |
|------|----------|---------|-------------|------------|------------|--|-------|
|      | Femur    | Patella | length 3.60 | width 2.64 |            |  |       |
| 1    | 3.00     | 1.60    | 2.41        | 2.41       | 1.60       |  | 11.02 |
| 2    | 2.72     | 1.20    | 2.00        | 2.00       | 1.48       |  | 9.40  |

| Palp | 0.88     | 0.40    | 0.50  |            | 0.75   | 2.53  |  |

**Colour** Carapace yellowish brown with a black band extending back from each lateral eye to merge at the fovea. Chelicerae orange-brown. Legs yellow, darkening to orange brown distally. Abdomen mottled with grey black and cream.

Figs. 63-64 *Orepekia dugdalei* n.sp. Fig. 63 Epigynum. Fig. 64 Internal genitalia.

**Carapace** The width of the head is equal to 7/10 of the width of the thoracic region. The lateral margins of the head are straight and parallel and extend down 3/10 of the length of the carapace.

**Eyes** The eyegroup occupies 3/5 of the width of the head. From above both rows are straight but from in front the anterior row is straight and the posterior row is slightly procurved. The ratio of AME.ALE.PME.PLE = 5.11.12.12. AME separated from each other by a distance equal to 6/5 and from the ALE by 3/5 of the diameter of an AME. Lateral eyes are separated by a distance equal to 3/5 of the diameter of an AME. PME separated from each other by 8/5 and from the PLE by 7/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 30.16 and wider behind than long in the ratio of 30.27. The height of the clypeus is equal to three times the diameter of an AME.

**Chelicerae** Chelicerae equal to 5/12 of the length of the carapace. Boss prominent. Retromargin with two teeth. Promargin with 5 minute teeth, followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.1.2. d.1.1. Tibia with 7 trichobothria arranged 1.2.2.2. Claw with 7 teeth.

**Legs** Spines. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, v.1.2.1. p.0.1.0. Metatarsus, v.2.2.1. p.1.1.2. r.0.0.2. d.0.1.0. Trichobothria. Tibia, 1.2.2.1.1. Metatarsus and tarsus, 5. Tarsal organ subdistal. Superior claws with from 8-9 teeth. Inferior claw with 3 long teeth.

**Abdomen** The epigynum and internal genitalia as in Figs. 63, 64. Posterior pair of spinnerets much more slender than the anterior pair and somewhat shorter. Colulus large and clothed with hairs.

**Type** Holotype female. Canterbury, Cass, moss, 23.v.1954, J. S. Dugdale (Otago Museum).

**Records** Goose Bay, Kaikoura, 2.vi.1952, J. S. Dugdale.

Figs. 76-79 *Orepukia prina* n.sp. Fig. 76 Tibial processes of male palp. Fig. 77 Ventral view of male palp. Fig. 78 Epigynum. Fig. 79 Internal genitalia.

**Colour** Except for conspicuous pale yellow areas extending from behind the eyes to the fovea and on the mid-lateral surfaces of the thoracic region, carapace dark brown. Legs orange brown with greyish brown bands. Abdomen heavily shaded with black brown but with two median pairs of pale spots on the antero-dorsal surface followed behind by three transverse rows of pale patches which form broken chevrons. Ventral surface with a row of pale spots on the lateral surfaces between the epigastric groove and the spinnerets.

**Eyes** The eyegroup occupies one half of the width of the head. From above the anterior row is straight and the posterior row is slightly procurved. From in front the rows appear the same but the posterior row is more strongly procurved. Ratio of AME.ALE.PME.PLE = 7.16.16.16. AME separated from each other by a distance equal to 6/7 and from the ALE by 3/7 of the diameter of an AME. Laterals eyes are separated by a distance equal to 5/7 of the diameter of an AME. PME separated from each other by 10/7 and from the PLE by 6/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 42.20 and wider behind than long in the ratio of 42.37. Height of the clypeus equal to 22/7 of the diameter of an AME.

**Chelicerae** Slightly less than one half of the length of the carapace. Retromargin with two teeth. Promargin with a single tooth and a carina which extends to the base of the chelicera.

**Palp** As shown in Figs. 80, 81.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.2. d.1.1.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. r.0.0.0.2. **Colour** Carapace pale brown with prominent reddish brown bands extending from the anterior corners to the fovea where they merge to form a single broad median band which continues back to the posterior margin. Chelicerae reddish brown. Legs yellow brown with reddish brown bands. Abdomen cream with indistinct pale brown markings.

**Eyes** Eyegroup compact occupying one half of the width of the head. From above both rows are straight but from in front both rows are slightly procurved. Ratio of AME.ALE.PME.PLE = 5.13.10.13. AME separated from each other by a distance equal to 8/5 and from the ALE by 5/5 of the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 10/5 and from the PLE by 7/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 30.18 and wider behind than long in the ratio of 30.25. Height of the clypeus equal to 11/5 of the diameter of an AME.

**Chelicerae** Chelicerae equal to 7/15 of the length of the carapace. Retromargin with two teeth. Promargin with five minute teeth followed by two normal teeth and a carina which extends to the base.

**Palp** Spines. Femur, d.0.1.1.1. p.0.1. Patella, d.1.1. Tibia, p.1.2. d.1.1. Tibia with eight trichobothria arranged 2.2.2.2. Claw with four teeth.

Figs. 96-97 *Orepukia tanea* n.sp. Fig. 96 Epigynum. Fig. 97 Internal genitalia.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.2. p.0.1.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.0.1. Tibia, v.2.2.2. p.0.1.1. Metatarsus, v.2.2.1. p.r.0.0.2. d.1.1.0. Metatarsal comb on legs 2-4, with 4, 8 and 5 bristles respectively. Trichobothria. Tibia, 1.2.1.2.2.1. Metatarsus, 6. Tarsus, 5. Superior claws with from 10-12 teeth. Inferior claw with two small teeth.

**Abdomen** The epigynum and internal genitalia are as in Figs. 94, 95. The posterior pair of spinnerets are only slightly smaller than the anterior pair.

**Type** Holotype female, Canterbury. Akaroa, 4.x.1949, R. R. Forster (Canterbury Museum).

Figs. 98-101 *Orepukia alta* n.sp. Fig. 98 Ventral view of male palp. Fig. 99 Tibial processes of male palp. Fig. 100 Epigynum. Fig. 101 Internal genitalia.

**Colour** The carapace is orange brown with a dark brown band extending back from each lateral eye to converge at the fovea and continue to the posterior margin as a broad median band. Chelicerae reddish brown. Legs pale brown with darker bands. Abdomen cream but heavily shaded with black patches which tend to leave pale areas, or a series of broken pale chevrons, down the median dorsal surface.

**Eyes** The eyegroup occupies one half of the width of the head and slightly overhangs the clypeus. From above both rows are straight but from in front the anterior row is straight and the posterior row is slightly procurved. Ratio of AME.ALE.PME.PLE = 8.15.12.14. AME separated from each other by a distance equal to 10/8 and from the ALE by 5/8 of the diameter of an AME. Lateral eyes separated by a distance equal to one half of the width of an AME. PME separated from each other by 13/8 and from the PLE by 14/8 of the diameter of an AME. MOQ wider behind than in front on the ratio of 37.26 and wider behind than long, in the ratio of 37.35. Height of the clypeus equal to 15/8 of the diameter of an AME.

**Chelicerae** Stout and swollen proximally. Retromargin with 2 teeth. Promargin with a group from 6-7 minute teeth and two normal teeth followed by a carina which extends to the base of the chelicera.

**Palp** As shown in Figs. 98, 99.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.2.2.2. p.1.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.2. p.1.1.1. | Palp | 2.80  | 1.20     | 1.60         |            | 2.20   | 7.80  |

**Colour** Carapace pale reddish brown. Chelicerae dark reddish brown. Legs pale reddish brown, darker distally. Abdomen greyish brown with a series of faint pale spots in pairs down the mid-dorsal surface.

**Carapace** The width of the head is equal to 2/3 of the width of the thorax. The lateral margins of the head are straight and parallel, and extend down 1/4 of the length of the carapace. The fovea is distinct.

**Eyes** The eyegroup occupies one half of the width of the head. From above both rows are straight but from in front the anterior row is straight and the posterior row is slightly procurved. The eyes are relatively small. Ratio of AME.ALE.PME.PLE = 17.25.19.26. AME separated from each other by a distance equal to 7/17 and from the ALE by 15/17 of the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other and from the PLE by a distance equal to 29/17 of the diameter of an AME. MOQ wider behind than in front in the ratio of 67.41 and longer than wide behind in the ratio of 71.67. Height of the clypeus equal to twice the diameter of an AME.

**Sternum** As long as wide. Anterior margin straight and lateral margins slightly undulate. Posterior projection short and sharp, separating coxae 4 by a distance equal to one half of the width of a coxa.

**Maxillae** Outer margins straight and the inner margins curved in distally over the labium. Twice as long as wide.

**Labium** Notched at the base. Lateral margins straight, almost parallel. Anterior margin slightly incurved. Longer than wide in the ratio of 6.5.

**Chelicerae** Chelicerae equal to 3/7 of the length of the carapace. Boss present. Retromargin with two teeth. Promargin with a row of 8 minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Legs** Clothed with smooth hairs. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, p.1.1.1. Metatarsus, v.2.2.1. p.r.0.0.1. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.1.2. p.0.1.1. Figs. 102-103 *Orepukia sabua* n.sp. Fig. 102 Epigynum. Fig. 103 Internal genitalia. Figs. 104-105 *Orepukia eliminata* n.sp. Fig. 104 Epigynum. Fig. 105 Internal genitalia. Figs. 106-107 *Orepukia nummosa* (Hogg). Fig. 106 Epigynum. Fig. 107 Internal genitalia.

near the base. Inferior claw with two or three teeth. The distal portions of the tarsi are clothed with a dense covering of hairs but this is not a distinct scopula.

**Abdomen** The posterior pair of spinnerets are more slender than the anterior pair and slightly shorter. Colulus relatively wide, clothed with hairs, with the posterior margin evenly curved.

#### FEMALE

The legs have become detached from the female type specimen but the spination would appear to be similar to the male. The epigynum and the internal genitalia are shown in Figs. 106, 107. The general structure is similar to the male.

**Type** Holotype female. Bounty Island, collected by Professor Benham (Otago Museum).

**Records** Immature male, with the same data as the holotype. Ringdove Bay, Antipodes Is., under stones in Penguin colony, 5.xi.1950, E. G. Turbott. This species does not fit readily in *Orepukia*.

The AME are relatively larger than other species and the overall size far exceeds that of

any of the species described from the mainland. There is little doubt however that it is related to the spiders placed in this genus and as it cannot remain in the genera in which it has been placed in the past it is listed under *Orepukia*.

#### *Neorepukia* n.gen.

Medium sized (body length 4.5-6.5mm) ecribellate spiders, which are separated from *Orepukia* mainly by the presence of plumose hairs. The internal genitalia are tubular and moderately convoluted as in some species of *Orepukia*. Unfortunately males are not known for the two species recorded.

Type species *Neorepukia pilama* n.sp.

#### *Neorepukia pilama* n.sp.

| Palp | 0.78  | 0.33    | 0.43  |            | 0.75   | 2.29  |

**Colour** Carapace pale yellow with a blackish brown band running back from the outer margins of the eyegroup to merge at the fovea and extend back as a single median band to the posterior margin of the carapace. Legs yellow brown with darker bands. Sternum yellow with dark brown shading on the margins and a median longitudinal band. Abdomen cream, heavily shaded with blackish brown on the lateral surfaces and with fewer dark patches on both dorsal and ventral surfaces.

**Carapace** The width of the head is equal to 5/7 of the width of the thoracic region. Lateral margins of the head straight and parallel, extending back a distance equal to 3/10 of the length of the carapace. Fovea distinct.

**Eye** Ringed with black. The eyegroup occupies 3/5 of the width of the head. From above both rows are straight. From in front the anterior row is straight and the posterior row is slightly procurved. Ratio of AME. ALE:PME:PLE = 6.11.11.11. AME separated from each other by a distance equal to 6/6 and from the ALE by 3/6 of the diameter of an AME. Lateral eyes separated by 3/6 of the diameter of an AME. PME separated from each other by 8/6 and from the PLE by 7/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 10.6 and wider behind than long in the ratio of 10.9. The height of the clypeus is equal to 8/6 of the diameter of an AME.

**Sternum** Anterior margin straight and the lateral margins evenly curved. Posterior projection sharply pointed, separating coxae 4 by a distance equal to one quarter of the width of a coxa.

**Maxillae** Lateral margins straight and parallel. Anterior margin gently curved. Longer than wide in the ratio of 14.9.

**Labium** Notched at the base. Lateral margins straight and convergent. Anterior margin gently incurved. Wider than long in the ratio of 8.7.

**Chelicerae** Retromargin with two teeth. Promargin with four minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** Spines. Femur, d.0.1.1.0. p.0.0.0.1. Tibia, p.1.2. d.1.1. Tibia with five trichobothria arranged 2.2.1. Claw with seven teeth.

**Legs** 4123. With plumose hairs. Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.2. p.0.0.1. Metatarsus, v.2.2.2. p.r.0.0.1. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.1.0.1. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.2. Third leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.1.1.1. r.0.1.1. d. 1.0.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Fourth leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. There are irregular rows of bristles on the distal surface of metatarsi of legs 2 and 3 but fourth metatarsus with a typical comb consisting of four bristles. Trichobothria. Tibia, 1.2.1.1.2.1. Metatarsus and tarsus, 5. Superior claws with ten-eleven teeth. Inferior claw with three long teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 108, 109. The posterior pair of spinnerets are more slender than the anterior pair but are only slightly shorter. The colulus is large.

**Type** Holotype female. Cook Strait. Stephen Island, leafmould, 19.v.1950, R. R. Forster (Dominion Museum).

### Measurements

|         | Carapace | length  | 3.20  | width      | 2.00   |       |
|---------|----------|---------|-------|------------|--------|-------|
| Abdomen | length   | 3.12    | width | 1.80       |        |       |
| Leg     | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1       | 2.38     | 0.90    | 2.13  | 1.93       | 1.13   | 8.47  |
| 2       | 2.03     | 0.90    | 1.43  | 1.73       | 0.88   | 6.97  |
| 3       | 2.15     | 1.00    | 1.68  | 1.73       | 1.00   | 7.56  |
| 4       | 2.58     | 1.00    | 2.13  | 2.35       | 1.05   | 9.11  |
| Palp    | 1.13     | 0.50    | 0.60  |            | 1.08   | 3.31  |

**Colour** Carapace deep orange brown with darker, reddish brown, shading on the lateral margins of the head, merging at the fovea to extend back to the posterior margin as a band. Chelicerae reddish brown. Legs orange brown. Abdomen heavily shaded with blackish brown on the dorsal and lateral surfaces. Ventral surface pale.

**Carapace** Width of the head region equal to 7/10 of the width of the thorax. Lateral margins of the head sub-parallel. Fovea distinct.

**Eyes** The eyegroup is compact and occupies 3/5 of the width of the head. From above the anterior row is straight and the posterior row is gently procurved. From in front the AME are level with the posterior margin of the ALE and the posterior row is strongly procurved. Ratio of AME.ALE.PME.PLE = 7.13.12.15. AME separated from each other by a distance equal to 8/7 and from the ALE by 3/7 of the diameter of an AME. Lateral eyes separated by 5/7 of the diameter of an AME. PME separated from each other by 11/7 and from the PLE by 9/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 35.22 and wider behind than long in the ratio of 35.34. Height of clypeus equal to 11/7 of the diameter of an AME.

**Sternum** Longer than wide in the ratio of 7.6. Anterior margin straight. Lateral margins evenly curved to the posterior margin of coxae 3 where the margins slope steeply in to the posterior projection. Posterior projection short and sharp and separates coxae 4 by a distance equal to one third of the width of a coxa.

**Maxillae** Twice as long as wide. Inner margins straight and parallel. Outer margins gently curved.

**Chelicerae** Retromargin with two teeth. Promargin with a row of 5 minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** Spines. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1.1. Tibia, p.1.2. d.1.1. Tibia with nine trichobothria arranged 1.2.2.2.2. Claw with twelve teeth.

**Legs** 4123. Heavily clothed with plumose hairs. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.2.2.2. p.0.1.1. Metatarsus, v.2.2.2. p.0.1.1. r.d.0.0.1. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.1.2. p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.r.1.2.2. Third leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.1.2.2. p.1.1.1. Metatarsus, 2.2.1. p.1.1.2. r.0.1.2. d.0.1.0. Fourth leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. d.0.1.0. Metatarsi of legs 3 and 4 with bristles on the disto-ventral surfaces which form an irregular row. Trichobothria. First leg. Tibia, 1.1.1.1.1.1. Metatarsus, 5. Tarsus, 3. Other legs. Tibia, 1.2.2.2.1.1.1. Metatarsus, 5. Tarsus, 3. Superior claws with from eight-eleven teeth. Inferior claw with three teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 110,111. Posterior pair of spinnerets as broad as the anterior pair but shorter. The colulus appears to be relatively large but is difficult to see on the type specimen.

30.xi.1947, R. R. Forster (Dominion Museum).

# Mahura n.gen.

Small terrestrial spiders (1.5-3.5mm in body length). Cribellate or ecribellate. Cribellum when present small and divided. Colulus small and setose, of same shape as cribellum. Calamistrum proximal, never strongly developed, with from 5-10 fairly long bristles. Legs relatively short, prograde, usually female 4123, male 1423. Trichobothria in double row on tibiae and a single row on metatarsi and tarsi. Superior claws similar and strongly pectinate. Inferior claw with one or two teeth. Claw tufts, scopulae and tenent hairs absent. Without plumose hairs. Prolateral spine of the femur of the first pair of legs may or may not be present. Spination of femora usually d.1.1.1.1. p.r.0.1. Tibia of the first pair of legs lacking the distal pair of ventral spines and usually the lateral spines. The tibial dorsal spines are present on all legs, any reduction being in the length of the spines. The distal whorl of metatarsal spines reduced to three or two in number. Tarsal organ distal to trichobothria on legs. Trochantera with very wide but shallow indentations. Palpal tarsus without trichobothria. Colulus of ecribellate species usually medially notched on the posterior margin (*M. turris* and others).

The eyegroup occupies about two-thirds of the width of the head. The anterior row is usually straight and the posterior row slightly procurved. Lateral eyes narrowly separated. AME very small, at most equal to one half of the diameter of an ALE. ALE, PME and PLE subequal. Sternum scutiform, usually a little longer than wide. Labium notched at the base and normally wider than long. Maxillae sub-parallel. Chelicerae short, vertical, with boss. Retromargin with two teeth and promargin with from 5-7 teeth. Epigynum small but usually with well developed surface features. Internal genitalia simple, usually receptaculate with short ducts. Male palp with prominent retrolateral processes on the tibia. Bulb provided with embolus, conductor and median apophysis. Embolus spiniform, evenly curved, distal portion housed along the outer margin of a prominent T-shaped translucent conductor. Median apophysis well developed, usually spiniform but sometimes hooked apically.

Type species *Mahura turris* n.sp.

These small spiders are common on the forest floor where they live amongst the litter. A single male, representing an undescribed species, collected from under stone on Echo Pass, Fiordland at 6,400 ft, suggests that this genus may also extend into the sub-alpine region. They do not appear to construct a snare and are very fast moving. Both cribellate and ecribellate species are included in the genus and some pairs of species e.g. *spinosa-spinosoides*, *scuta-southgatei* are, apart from the presence or absence of the cribellum and calamistrum, quite difficult to separate.

**Colour** Carapace pale yellow, with black shading on the head and faint dark bands extending from the fovea to the lateral margins where they merge with a thin black band which extends along the margin of the

Fig. 112 *Mahura southgatei* n.sp. male.

thoracic region. The abdomen is heavily mottled with blackish brown which is broken up to form indistinct pale chevrons on the postero-dorsal surface. Sternum reddish brown with thin black shading. Legs banded with blackish brown.

**Eyes** The eyegroup is relatively compact and occupies 3/9 of the width of the head. From above the posterior row is slightly procurved and the anterior row is straight. From in front both rows are definitely procurved. Ratio of AME.ALE.PME.PLE = 2.6.6.6. AME separated from each other by 3/2 and from the ALE by 2/2 of the diameter of an AME. Laterals subcontiguous. PME separated from each other by 4/2 and from the PLE by 2/2 of the diameter of an AME. MOQ wider behind than in front in the ratio of 16.7 and longer than wide in the front in the ratio of 13.7. Clypeus narrow, equal in height to 5/2 of the diameter of an AME.

**Sternum** Scutiform, longer than wide in the ratio of 11.10. Anterior margin straight. Lateral margins evenly curved to the posterior projection which separates coxae 4 by a distance equal one half of the width of a coxa.

**Maxillae** Longer than wide at the base in the ratio of 5.3. Lateral margins straight, anterior margin gently curved.

**Labium** Notched at the base, wider than long in the ratio of 3.2. Lateral margins gently curved. Anterior margin straight.

**Chelicerae** Retromargin with two strong teeth, promargin with a distal row of five small peg-like teeth followed by one large and one small typical tooth.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1.1. Tibia, p.1.2. d.1.1. Tarsus many. Tarsal claw with six teeth. Six trichobothria on tibia arranged 2.2.2.

**Legs** Clothed with finely ciliate hairs. Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.2. Tibia, v.2.2.0. d.1.0.1. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1.1. |     | Carapace | length  | width |            |        |       |
|-----|----------|---------|-------|------------|--------|-------|
|     | Abdomen  | length  | width |            |        |       |
| Leg | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1   | 1.38     | 0.55    | 1.30  | 1.10       | 0.75   | 5.08  |
| 2   | 1.15     | 0.50    | 0.93  | 0.90       | 0.63   | 4.11  |
| 3   | 1.05     | 0.43    | 0.75  | 0.90       | 0.50   | 3.63  |
| 4   | 1.35     | 0.45    | 1.10  | 1.18       | 0.65   | 4.73  |

**Colour** Carapace and legs orange brown. Abdomen mottled with yellow brown and grey.

**Eyes** the eyegroup occupies 2/3 of the width of the head. From above both rows are straight but from in front both rows are slightly procurved. The ratio of AME.ALE.PME.PLE = 4.9.9.9. AME separated from each other by 3/4 and from the ALE by 2/3 of the diameter of an AME. Lateral eyes are subcontiguous. PME separated from each other by 5/4 and from the

PLE by 2/4 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.11 and wider behind than long in the ratio of 23.21. Height of the clypeus is equal to 9/4 of the diameter of an AME.

**Chelicerae** Two sevenths of the length of the carapace. Retromargin with two teeth. Promargin with 5 minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** As shown in Figs. 121, 122.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.2.0. Metatarsus, v.2.2.2. p.0.1.0. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.2.0. p.0.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.r.0.1.2. Trichobothria. Tibia, 1.1.2.1. Metatarsus and tarsus, 4. Superior claws with from nine-ten teeth. Inferior with two long teeth. No calamistrum.

**Abdomen** The posterior pair of spinnerets are slightly smaller than the anterior pair. The anterior pair are widely separate at the base. The colulus is small, with hairs on the basal portion but the anterior portion smooth.

**Colour** Cephalothorax and legs pale reddish brown. Dorsal surface of the abdomen with five broad transverse bands of which the third and the fourth are bent to form chevrons. The ventral surface of the abdomen is pale.

**Eyes** The eyegroup is compact and occupies one half of the width of the head. From above both rows appear straight but from in front the AME are seen to be level with the posterior margin of the ALE and the posterior row is gently procurved (Fig. 131). Ratio of AME.ALE.PME.PLE. = 2.6.7.9. AME separated from each other by 2/2 and from the ALE by 1/2 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 4/2 and from the PLE by 2/2 of the diameter of an AME. MOQ wider behind than in front in the ratio of 9.3 and wider behind than long in the ratio of 9.8. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Slightly more than 1/4 of the length of the carapace. Retromargin with two teeth. Promargin with one large tooth followed by a carina which extends to the base of the chelicera.

**Palp** Spines. Femur, d.0.0.1.1. Patella and tibia d.1.1. Six trichobothria on the tibia arranged in three pairs. Claw with from eight-nine teeth. Tarsal organ subdistal.

**Legs** Calamistrum weak, consisting of a few hairs on the median surface. Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.1. Tibia, v.2.2.0. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.1.1.0. p.0.1.1. Metatarsus, v.2.2.2. p.0.1.2. Trichobothria. Tibia, 1.1.2.1. Metatarsus, 4. Tarsus, 3. Superior claws with from eleven-12 teeth. Inferior with two long teeth.

**Abdomen** The epigynum and the internal genitalia are shown in Figs. 132, 133. The anterior pair of spinnerets are stouter and longer than the posterior pair and are separated at the base by a distance equal to the width of the base of a spinneret. Cribellum large, twice as wide as long, with the posterior margin evenly curved.

**Type** Holotype female. Fiordland. Routeburn Valley, 800 ft, J. T. Salmon (Dominion Museum).

| 4    | 0.90     | 0.35    | 0.70  | 0.75       | 0.45   | 3.15  |
| Palp | 0.40     | 0.20    | 0.25  |            | 0.35   | 1.20  |

**Colour** Carapace pale brownish cream with the lateral and posterior slopes with dark shading. The median fovea reddish brown and the radial striae conspicuously shaded with black. The eyes are on a common black patch which does not include the space between the PME. The colour of the legs is similar to that of the carapace but with less shading. The sternum with dark stippling which is darker on the posterior projection. Abdomen evenly shaded with brownish grey and with pale flecks. There is a pair of pale spots on the antero-medial surface followed by several rather indistinct pale chevrons. Ventral surface slightly paler, bounded on each side by a row of pale spots and a series of three pairs of pale spots between the epigastric furrow and the spinnerets.

**Eyes** The eyegroup occupies 3/5 of the width of the head. From in front the anterior row is procurved so that the posterior margins of the AME are behind the posterior margins of the ALE and the posterior row is procurved.

Figs. 134-137 *Mahura spinosoides* n.sp. Fig. 134 Ventral view of male palp. Fig. 135 Tibial processes of male palp. Fig. 136 Epigynum. Fig. 137 Internal genitalia. Figs. 138-139 *Mahura spinosoides* n.sp. Fig. 138 Epigynum. Fig. 139 Internal genitalia.

From above the anterior row is straight and the posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 1.4.4.4. AME separated from each other by slightly more and from the ALE by slightly less than the diameter of an AME. Laterals narrowly separated. PME separated from each other by twice the diameter of an AME and from the PLE by a diameter of an AME. MOQ wider behind than in front in the ratio of 10.3 and wider behind than long in the ratio of 10.7. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Promargin with three teeth, the median tooth being the largest and the retromargin with two teeth situated closer to the base of the fang than the promarginal teeth.

**Palp** Spines. Femur, d.1.1.1. p.r.0. Patella, 1.1. Tibia, d.p.1.1. Trichobothria. Tibia, two rows each with 1.1.1. Tarsus, 0. Claw with six teeth.

**Legs** Spines. First leg. Femur, prolateral spine wanting, d.1.1.1. p.0.1. r.0. Patella, 1.1. Tibia, v.2.2.0. p.r.0. d.1.1. Metatarsus, v.2.2.3. p.r.0. Superior claws with ten teeth and inferior with two teeth. Trichobothria. First leg. Tibia, in two rows each with four. Metatarsus, 4. Tarsus, 3. Calamistrum wanting.

**Abdomen** Colulus rather wide at the base and rounded at the summit. The epigynum and internal genitalia are shown in Figs. 138, 139.

**Type** Holotype female. Fiordland. Lake Hau-roko, 25.xi.1970, R. R. Forster, C. L. Wilton (Otago Museum). Paratype females, same data.

**Records** Lake Hau-roko, 11.iii.1970, C.L.W. Wairaurahiri area, Western Southland, 28.v.1948, G. Weston.

| Palp | 0.60  | 0.20    | 0.20  |            | 0.68   | 1.68  |

**Colour** Carapace pale yellow brown with faint darker bands extending from the anterior corners of the head to merge at the fovea. Legs pale yellow brown. Abdomen cream, shaded with reddish brown.

**Eyes** The eyegroup is large and occupies 10/13 of the width of the head. PME relatively large and each eye is surrounded with black pigment. From above both rows appear straight. From in front the AME are level with the posterior margin of the ALE and the posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 3.7.9.7. AME separated from each other by 3/3 and from the ALE by 2/3 of the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 5/3 and from the PLE by 2/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.9 and wider behind than long in the ratio of 23.18. Height of the clypeus equal to 10/3 of the diameter of an AME.

**Chelicerae** One third of the length of carapace. Retromargin with two teeth. Promargin with five minute teeth and two normal teeth followed by a carina which extends to the base of the chelicera.

**Palp** Tibia with a number of small processes as shown in Fig. 145. The ventral surface is produced ventrally into a broad lobe. The median apophysis is flattened distally and cupped (Fig. 144).

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.0. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.2.0. p.0.0.1. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.2. Trichobothria. Tibia, 2.2.1.1. Metatarsus, 4. Tarsus, 3. Superior claws with from nine-eleven teeth. Inferior claw with two long teeth.

**Abdomen** The posterior pair of spinnerets are slightly smaller than the anterior pair. A small colulus is present, clothed with short hairs.

| Palp | 0.45  | 0.20    | 0.25  |            | 0.40   | 1.30  |          |       |         |       |

Figs. 144-147 *Mahura takahea* n.sp. Fig. 144 Ventral view of male palp. Fig. 145 Tibial processes of male palp. Fig. 146 Epigynum. Fig. 147 Internal genitalia.

**Colour** The female described is darker than the holotype male. There is a series of three indistinct pale chevrons on the posterior half of the dorsal surface of the abdomen. The ventral surface of the abdomen is pale but merges into the darker lateral surfaces on each side. The femora of all the legs have incomplete dark bands visible on the ventral surfaces.

**Eyes** The group occupies about two thirds of the width of the head. From in front and from above both rows are procurved. The ratio of AME.ALE.PME.PLE = 2.5.4.5. AME separated from each other by a distance equal to 2/2 and from the ALE by 1/2 of the diameter of an AME. Lateral eyes are narrowly separated. PME separated from each other and from the PLE by distance equal to the diameter of an AME. MOQ wider behind than in front in the ratio of 10.6 and wider behind than long in the ratio of 10.9. Height of the clypeus is equal to 3/2 of the diameter of an AME.

**Chelicerae** The retromargin has two even teeth which are almost touching. The promargin has a carina and two teeth. The five minute teeth possessed by a male appear to be lacking.

**Palp** Spines. Femur, d.1.1.1.1. p.r.0. Patella, 1.1. Tibia, d.0.1. p.1.2. r.0. Tarsus, numerous. Trichobothria. Tibia, 1.1.1. Tarsus, 0 but with a subdistal tarsal organ. The claw has six teeth.

**Legs** The prolateral spine on the femur of the first leg is not present. There is no calamistrum. Although stout setae are present distally on the metatarsi of the second, third and fourth legs these are not arranged in a comb.

**Abdomen** The cribellum has been reduced to a colulus shaped like a truncate cone. The epigynum and internal genitalia are shown in Figs. 146, 147.

**Types** Holotype male and allotype female. Fiordland. Takahē Valley, 20.ii.1954, P. C. Bull (Otago Museum).

**Colour** Cephalothorax and legs pale yellow. Abdomen cream.

**Eyes** The eyegroup is compact and occupies 7/12 of the width of the head. From above both rows appear straight but from in front the anterior row appears straight and the posterior row is gently procurved. Ratio of AME.ALE.PME.PLE = 3.8.7.7. AME separated

from each other by a distance equal to 2/3 and from the ALE by 1/3 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 5/3 and from the PLE by 2/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 19.8 and wider behind than long in the ratio of 19.14. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Slightly less than one third of the length of the carapace. Retromargin with two teeth. Promargin with four minute teeth followed by two normal teeth and a carina which extends to the base of the chelicera.

**Palp** Tibia with a strong bifid spine on the retrolateral surface, median apophysis swollen subdistally (Fig. 152).

**Legs** Clothed with slender, finely ciliate hairs. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.2.2.0. Metatarsus, v.2.2.2.2. p.0.0.1. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.1.2.1. p.0.1.1. d.0.1.0.0. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.2. Trichobothria. Tibia, 1.2.1.1. Metatarsus, 4. Tarsus, 3. Superior claws with eight teeth, inferior claw with three long teeth. No calamistrum.

**Abdomen** The posterior pair of spinnerets are relatively small. Anterior pair of spinnerets separated at the base. Colulus small and clothed with short hairs.

**Types** Holotype male. Westland. Waiho Gorge, leafmould and moss, 26-27.i.1954, J. T. Salmon (Dominion Museum).

The female is similar in general structure to the male. The head region of the carapace is more clearly defined with the lateral margins parallel rather than convergent. The palp is spined as follows. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.d.1.1. Six trichobothria present on the tibia in three pairs. Claw with seven teeth. The epigynum is characterised by a broad triangular median plate and narrow lateral flanges (Fig. 159). The internal genitalia are shown in Fig. 160.

##### Measurements

| Carapace | length | width |
|----------|--------|-------|
| Abdomen  | length | width |
|          | 1.14   | 0.78  |
|          | 1.44   | 1.02  |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 0.72  | 0.31    | 0.60  | 0.48       | 0.38   | 2.49  |
| 2    | 0.66  | 0.30    | 0.44  | 0.42       | 0.36   | 2.18  |
| 3    | 0.66  | 0.30    | 0.42  | 0.46       | 0.34   | 2.18  |
| 4    | 0.80  | 0.36    | 0.62  | 0.46       | 0.37   | 2.81  |
| Palp | 0.36  | 0.22    | 0.24  |            | 0.32   | 1.13  |

**Colour** Cephalothorax and legs uniform yellow-brown. Abdomen cream with sparse black shading.

**Eyes** The eyegroup is compact and occupies 5/9 of the width of the head. From above both rows appear straight. From in front both rows are gently procurved. Ratio of AME.ALE.PME.PLE = 1.6.5.6. AME separated from each other by twice the diameter of an AME. AME separated from the ALE by a distance equal to the diameter of an AME. Laterals contiguous. PME separated from the PLE by a distance equal to the diameter of an AME and separated from each other by a distance equal to 4 times the diameter of an AME. MOQ wider behind than in front in the ratio of 14.4 and wider behind than long in the ratio of 14.9. Height of the clypeus equal to 5 times the diameter of an AME but this ratio reflects the small size of the AME rather than the relative height of the clypeus when compared with other species.

**Chelicerae** Retromargin with two teeth, promargin with five of which the distal three are small.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.1.1. Tarsus many. Claw with six teeth. Five trichobothria on tibia arranged 1.1.2.1.

**Legs** Spines. First leg. Femur, d.0.1.1.0. p.0.0.1. patella, d.1.1. Tibia, v.2.2.0. d.1.0.1. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.0. p.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.1. d.0.0.2. Trichobothria are present on all tibiae, metatarsi and tarsi in a single row of three. Superior claws of legs 1 and 2 with 11 teeth, 3 and 4 with seven teeth. Inferior claw appears to be smooth. The calamistrum consists of six hairs and extends down one third of the segment.

**Abdomen** The median plate of the epigynum is well developed and is shown in Fig. 161. Cribellum small, divided.

**Type** Holotype female. Canterbury. Lake Taylor, leafmould, iv.1952, R. R. Forster.

**Records** Arthurs Pass, 2.xi.1969, C.L.W. Arthurs Pass, 9.xii.1949, 12.ix.1949, R.R.F. Arthurs Pass, moss, April 1955, R. L. Pilgrim. Rough Creek, Arthurs Pass, moss, 28.iii.1954, J. S. Dugdale. |      | Abdomen  | length  | width |            |        |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 1.00     | 0.45    | 0.85  | 0.70       | 0.50   | 3.50  |
| 2    | 0.90     | 0.45    | 0.65  | 0.60       | 0.45   | 3.05  |
| 3    | 0.80     | 0.40    | 0.50  | 0.70       | 0.40   | 2.80  |
| 4    | 1.05     | 0.50    | 0.85  | 0.90       | 0.50   | 3.80  |
| Palp | 0.45     | 0.25    | 0.25  |            | 0.45   | 1.40  |

**Colour** Carapace rather pale cream but heavily shaded on the head, posterior slope, upper lateral surfaces and margins. Eyes on a black patch which does not include the space between the PME. Legs cream with dark bands which are most conspicuous on the ventral surfaces of the femora. The distal halves of the coxae are

shaded black and also the sternum and mouth parts. The abdomen is brownish grey with pale flecks. There is an indistinct pattern of chevrons on the mid-dorsal and posterior surfaces. Both the mid-dorsal and ventral surfaces have a reddish tinge.

**Eyes** The group occupies 7/12 of the width of the head. From in front the anterior row is procurved so that the posterior margins of the AME are behind those of the ALE and the posterior row is procurved. From above the anterior row is slightly recurved and the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 2.5.5.5. AME separated from each other by 1/2 their diameter and from the ALE by slightly less than that distance. Laterals narrowly separated. PME separated from each other by the diameter of an AME and from PLE by slightly less than that distance. MOQ wider behind than in front in the ratio of 12.5 and wider behind than long in the ratio of 12.11. Height of the clypeus equal to twice the diameter of an AME.

**Palp** Spination and trichobothrial pattern typical. Claw with seven teeth.

**Legs** Femoral spines rather long. Prolateral spine on the femur of the first pair of legs wanting. Spines. First leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. (small). Tibia, v.2.2.0. p.r.0.0. d.1.1. (small). Metatarsus, v.2.2.0. p.1 median, 1 distal. r.0.1 distal. Trichobothria. Tibia, pro-row, 5, retro-row, 5. Metatarsus, 5. Tarsus, 4. Superior claws with nine teeth and inferior claw with one tooth. Calamistrum lacking.

**Abdomen** Colulus relatively large and notched behind. The epigynum and internal genitalia are shown in Figs. 163, 164.

| Palp         | 0.50     | 0.20    | 0.25  |            | 0.55   | 1.50  |

**Colour** The cephalothorax and appendages very pale cream. The lateral eyes and the AME are on a common black patch and the PME are each on separate black spots the anterior margins of which each touch the common black area. The dorsal surface of the abdomen is shaded black. On the anterior portion are three pairs of irregular pale spots which are followed by several pale chevrons. The ventral surface is pale with slight shading medially.

**Eyes** The group occupies 2/3 of the width of the head. From in front the anterior row is procurved so that the posterior margins of the small AME are behind the posterior margins of the ALE and the posterior row is procurved. From above both rows are very slightly recurved. Ratio of AME.ALE.PME.PLE = 2.4.4.4. AME separated from each other by half their diameter and separated from the ALE by slightly less than that

Figs. 169-170 *Mahura bainhamensis* n.sp. Fig. 169 Tibial processes of male palp and comb on the base of the cymbium. Fig. 170 Ventral view of male palp.

distance. Lateral eyes narrowly separated. PME separated from each other by a diameter of an AME and from the PLE by half that distance. MOQ wider behind than in front in the ratio of 10.5 and is wider behind than long in the ratio of 10.9. Height of the clypeus equal to 7/2 of the diameter of an AME.

**Palp** At the base of the retromargin of the cymbium is a row of curved setae resembling a calamistrum (Fig. 169). The tibial processes and the bulb are shown in Fig. 170.

**Legs** Spines. First leg. Femur, prolateral spine wanting, d.l.l.l. p.r.o.l. Tibia, v.2.2.0. p.o.l. r.o. d.l.o. Metatarsus, v.2.2.2. p.r.o. Second leg. Femur, d.l.l.l. p.r.o.l. Tibia, p.d.l.l. r.o. Metatarsus, v.2.2. and subwhorl of 5, p.l. r.o. Calamistrum wanting. Trichobothria. First leg. Tibia, in two rows each with 4. Metatarsus and tarsus, 3. Tarsal organ distal to the trichobothria. Superior claws with nine teeth and the inferior claw with one tooth.

**Abdomen** Colulus broad at the base with a rounded summit. Anterior spinnerets separated from each other by a distance equal to 2/3 of the diameter of an anterior spinneret.

**Type** Holotype male. Nelson, four miles south of Bainham, 9.iii.1967, C. L. Wilton (Otago Museum).

#### *Porotaka* n.gen.

Small (1.5-3mm in body length) spiders, both cribellate and ecribellate. Eyegroup compact with both rows definitely procurved from in front. AME minute. Remaining eyes subequal. Sternum shield shaped, as long as wide

or slightly longer than wide. Labium notched at the base, wider than long. Chelicerae with two teeth on the retromargin and from two-five on the promargin. Legs 4123. Plumose hairs lacking. Spination weak but spines present on all legs. Femora with mid-dorsal row of spines only. Tibia of the first pair of legs lacking the distal pair of ventral spines. Tibiae each with one basal dorsal spine. Metatarsal distal whorl of spines on the first pair of legs reduced to two spines. Trichobothria few but in double row on tibiae and a single row on metatarsi and tarsi. Tarsal organ subdistal. Superior claws similar and strongly pectinate. Inferior claw with a single or without teeth. Calamistrum when present proximal. Claw tufts, scopulae and tenent hairs lacking. Female palp with trichobothria in a double row on the tibia, but absent from the tarsus. Claw strongly pectinate. Tibia of male palp with retrolateral processes but without the spinous process characteristic of *Mahura*. Embolus spiniform, curving around the bulb from the retromargin. Conductor prominent, T-shaped. Median apophysis well developed but not hooked. Epigynum simple with a small plate on the posterior margin. Internal genitalia with spherical receptacula and clearly defined tubular ducts. Cribellum when present small, with divided spinning field. Colulus small, setose.

Type species *Porotaka detrita* n.sp.

The two species described below, one cribellate and the other ecribellate, are undoubtedly related but if further species were known they would probably be placed into separate genera. *Porotaka* is closely related to *Mahura* and is separated from it mainly by the form of the receptacula and ducts of the internal genitalia and the simple epigynum. The male palp also lacks the sharp retrolateral process on the tibia typical for *Mahura*. These spiders are at present recorded from the north-

west portion of the South Island but a further undescribed cribellate species from the Wairarapa is present in the collections studied.

| Palp | 0.44     | 0.20    | 0.21  |            | 0.33   | 1.18  |

**Colour** Carapace and legs straw yellow. Abdomen with a broad reddish brown band down the dorsal surface. Ventral surface reddish brown.

**Eyes** Compact group occupying 17/22 of the width of the head. Both strongly procurved when viewed from above or in front (Fig. 171). Ratio of AME.ALE.PME. PLE = 2.8.10.10. AME separated from each other by a distance equal to and from the ALE by one half of the diameter of an AME. Lateral eyes separated by one and

a half the diameter of an AME. PME separated from each other and from the PLE by a distance equal to the diameter of an AME. MOQ wider behind than in front in the ratio of 22.6 and longer than wide in the front in the ratio of 19.6. Clypeus three times as high as the diameter of an AME.

**Carapace** Narrowing sharply in the head region where the anterior width is 4/9 of the thoracic width. The cephalic groove is not distinct and the head region merges with the thorax.

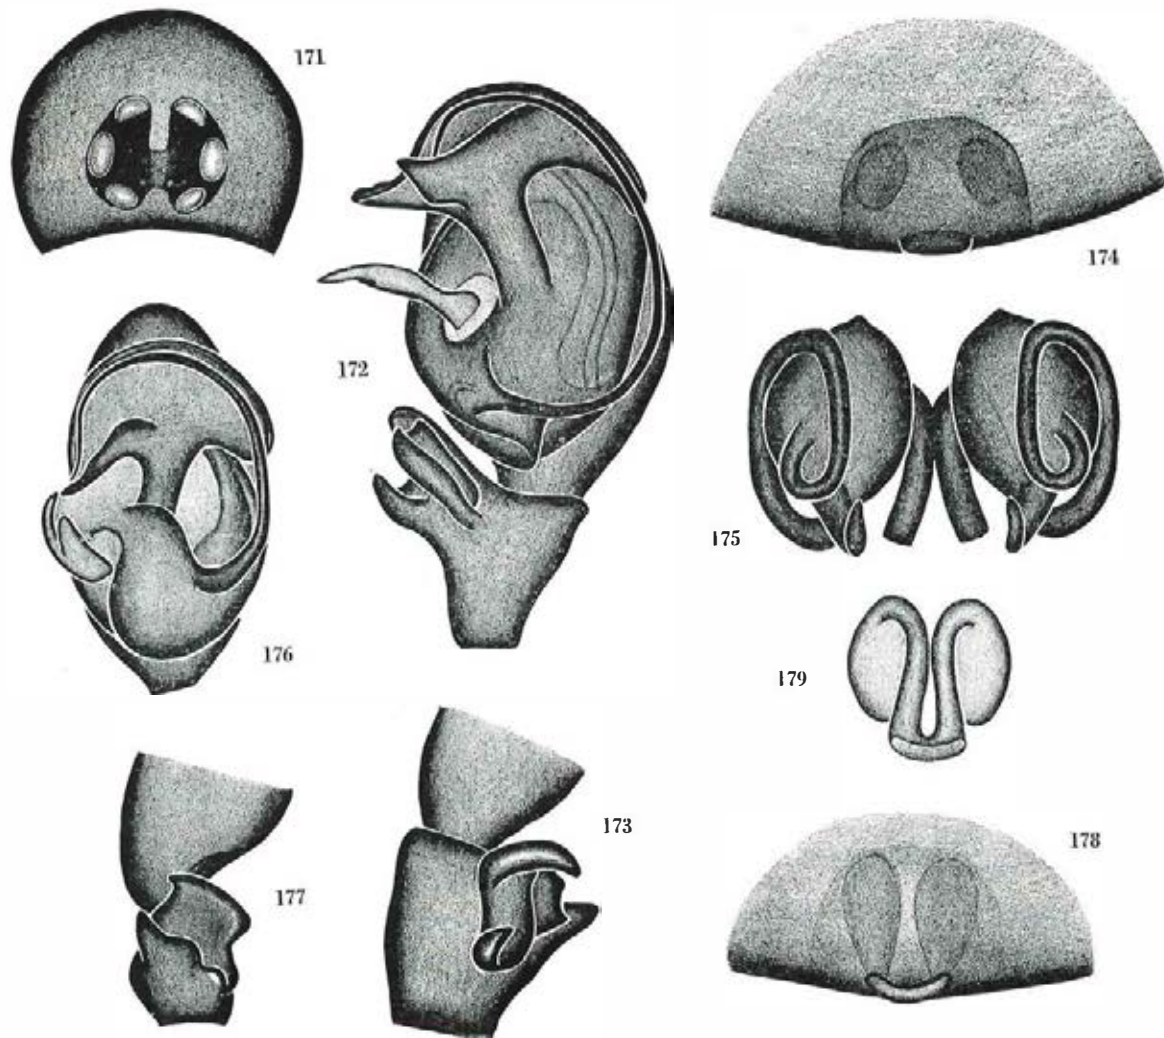

**Maxillae** Obliquely rectangular and slightly convergent.

**Labium** Wider than long in the ratio of 9.5. Anterior margin evenly rounded, notches absent.

**Chelicerae** Two teeth on each margin.

**Sternum** Scutiform. As wide as long, pointed posteriorly where coxae 4 are separated by one half of the width of a coxa.

**Legs** Superior claws with seven-eight teeth. Inferior smooth. Tarsal organ subdistal on the first leg but situated at about three-quarters of the length of the tarsus on other legs. Spines. Leg 1. Femur, d.1.1.1. Patellae, d.0.1. Tibia, v.1.1.0. Metatarsus, v.1.2.1. Leg 2. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.1.1.0. p.0.0.1. v.1.1.1. Metatarsus, v.1.2.2. p.r.1. distal. Leg 3. Femur, d.1.1.1. p.1 subdistal. Patella, d.1.1. Tibia, p.r.1.0.1.1.

**Colour** Cephalothorax yellow brown with faint dark shading. Legs uniform orange brown. Abdomen cream with dark shading forming indistinct bands on the posterior half of the dorsal surface.

**Eyes** The eyegroup is compact and occupies one half of the width of the head. From above both rows appear straight. In front the anterior row appears straight but the posterior row is gently procurved. Ratio of AME.ALE.PME.PLE = 1.4.4.4. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Laterals contiguous. PME separated from each other by three times and from the PLE by twice the diameter of an AME. Height of the clypeus equal to three times the diameter of an AME. MOQ wider behind than in front in the ratio of 11.3 and wider behind than long in the ratio of 11.7.

**Sternum** Longer than wide in the ratio of 9.7. Anterior margin straight, lateral margins evenly curved. Coxae 4 separated from each other by a distance equal the width of a coxa.

**Maxillae** Convergent. Lateral margins straight and parallel. Anterior margin rounded. Twice as long as wide.

**Labium** Evenly rounded. Twice as wide as long.

**Palp** Spines. Femur and patella, d.0.0.1. Tibia, p.1. Tarsus many. Three trichobothria on tibia arranged 2.1. Tarsal claw with four minute teeth.

**Legs** 4123. Spines. First leg. Femur, d.0.1.0.0. Tibia, v.0.2.2. Metatarsus, v.1.2.1. Second leg. Femur, d.0.1.0. Tibia, v.0.1.2. Metatarsus, v.0.1.0. Third leg. Tibia, v.0.1.2. p.1.1.0. **Types** Holotype male, allotype female. Nelson. Leslie Valley Track, leafmould from beech forest, 23.i.1948, R. R. Forster (Dominion Museum).

**Tuapoka n.gen.**

Minute (1.5-2mm in body length) cribellate spiders. The eyegroup occupies approximately 3/5 of the width of the head. Both rows straight or only slightly procurved. AME very small. Remaining eyes sub-equal. Sternum scutiform, longer than wide. Labium much wider than long and notched at the base. Chelicerae vertical, with boss. Retromargin with one-two and promargin with three-five teeth. Legs 4123, clothed with ciliate hairs. Strongly spined on all legs. Femora with no more than the two basal spines of the mid-dorsal row sometimes reduced to one. The distal ventral spines of the tibia of the first pair of legs wanting. Distal whorl on the metatarsus of the first pair of legs reduced to one or two spines. All tibiae with one dorsal spine only, situated basally. Trichobothria few, in a double row on the tibiae and a single row on metatarsi and tarsi. Superior claws similar and strongly pectinate. Inferior claw smooth or with a single tooth. Claw tufts and tenent hairs absent. Calamistrum proximal, with from seven-eight hairs. Epigynum with a large median cavity. Internal genitalia tubular without distinct spherical receptacula. Anterior pair of spinnerets distinctly separated. Cribellum much wider than long. Spinning fields divided. Male palp with strong retrolateral tibial processes. Embolus spiniform, stout, evenly curved. Conductor in form of a strong curved plate originating from near the base of the embolus and not modified distally. Median apophysis well developed, hooked apically.

Type species *Tuapoka ovalis* n.sp.

Fig. 184 *Tuapoka ovalis* n.sp. female.

These small spiders live in the litter and moss on the forest floor. *Tuapoka* is related to *Ahua* from which it has been separated mainly on the form of the female epigynum and the male palp. The epigyna are quite different and the conductor of the male palp is distally complex in *Ahua*.

| Palp | 0.25     | 0.16 | 0.16        |      | 0.21       |  | 0.78  |

**Colour** Legs pale yellow. Carapace with black shading along the lateral margins. Abdomen heavily shaded with black. Indefinite transverse bands along the posterior half of the dorsal surface.

**Eyes** The eyegroup occupies 8/13 of the width of the head. From in front both rows of eyes are slightly procurved. The eyes are surrounded with black pigment. Ratio of AME.ALE.PME.PLE = 1.3.3.3. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by twice and from the PLE by one and a half times the diameter of an AME. MOQ wider behind than in front in the ratio of 8.3 and twice as long as wide in front.

**Sternum** Scutiform, longer than wide in the ratio of 13.11. Posterior projection broadly rounded, separating coxae 4 by a distance equal to the width of a coxa.

*Chelicerae* Boss present. Retromargin with one and promargin with three teeth.

*Legs* Superior claws similar, with from eight-nine teeth. Inferior claw smooth. Spines. First leg. Femur, d.1.1.1. r.1 subdistal. Patella, d.1.1. Tibia, v.2.2.0. r.0.0.1. Metatarsus, v.2.2.2. Second leg. Femur, d.1.1.0. Patella, d.1.1. Tibia, v.1.2.0. p.0.0.1. Metatarsus, v.1.2.1. p.0.1.2. r.0.0.2. Third leg. Femur, d.0.1.1. Patella, d.1.1. Tibia, v.0.0.1.0. r.1.1.0. Metatarsus, v.0.0.1. p.0.0.2. Fourth leg. Femur, d.1.0.0. Patella, d.1.1. Tibia, v.1.2.2. p.0.1.0. Metatarsus, v.0.1.1. p.r.0.0.2. d.0.0.1. Trichobothria. Legs, 1, 2 and 4, Tibia, 1.2.1. Metatarsus, 1.1.1. Tarsus, 1.1. Leg 3, Tibia, 1.2. Metatarsus and tarsus, 1.1. Calamistrum proximal, with eight hairs.

*Abdomen* The cribellum is more than twice as wide as long. Posterior margin notched. Spinning field divided. Anterior pair of spinnerets separated by 3/5 of the width of a spinneret. The epigynum is similar to *ovalis* but the opening is distinctly in front of the furrow and lacks the lip on the posterior margin (Figs. 189, 190).

*Type* Holotype female. Otago. Above Whiskey Gulley, Tapanui, 26.ii.1966, J. Sutherland.

*Records* Stewart Is., leaf litter, 21.xi.1946, R.R.F. Stewart Is., Garden Mound, 20.xi.1946, R.R.F. Horseshoe Bay, 21.xi.1946, R.R.F. Catlins near Puketira Rd, 31.vii.1966, R.R.F., C.L.W. Tautuku, 10.i.1967, J. Sutherland. Five miles east of Lawrence, Waipori Rd, 10.x.1966, C.L.W.

This species is readily separated from *ovalis* by the pigmented carapace and abdomen.

*Distribution*—Stewart Island and the southern east coast of the South Island.

#### *Paramyro* n.gen.

Medium sized (4.5-5.5mm in body length) ecribellate spiders. The eyegroup is compact and occupies little more than one half of the width of the head. AME small remaining eyes large, subequal. The ALE and the posterior eyes are separated from each other and are arranged in a circle around the AME which are situated well back from the ALE (Fig. 191). Labium notched at the base and wider than long. Chelicerae with lateral boss. Retromargin with two teeth, promargin with from two-nine. Legs 4123. Strongly spined. Femur of the first pair of legs with prolateral spine. Spination of the femora d.1.1.1. p.r.0.1. Ventral surface of the tibia of the first pair of legs with distal spines. The distal whorl of the metatarsus of the first pair of legs with the median ventral spine missing, usually only two spines present. Dorsal spines on the tibiae are reduced to bristles on the first and second pairs of legs and recumbent on the third and fourth. Trichobothria in a double row on tibiae and a single row on metatarsi and tarsi. Tarsal organ subdistal. Superior claws strongly pectinate, similar. Inferior claw with two teeth. Female palp with double row of trichobothria on the tibia single row on metatarsus but none on the tarsus. Claw pectinate. Epigynum simple with a ridge but no spines. Internal genitalia with small receptacula and strong convoluted ducts. Colulus small, setose. Tracheal spiracle near base of spinnerets. Male not known.

*Type species* *Paramyro apicus* n.sp.

The unusual arrangement of the eyes is very similar to that found in *Myro* and other genera of the Myroninae but the tracheal system of the specimen examined seems to consist of four simple tubes. The placing of this genus must remain doubtful until males are found. In the meantime we have associated it with the *Orepukia* group of genera.

| 3    | 1.55     | 0.83    | 1.10  | 1.38       | 0.70   | 5.56  |
| 4    | 2.05     | 0.93    | 1.55  | 1.88       | 0.95   | 7.36  |
| Palp | 0.75     | 0.35    | 0.43  |            | 0.75   | 2.28  |

*Colour* Carapace orange brown with dark brown shading on the lateral surfaces of the head and radiating out from the fovea. Legs orange brown. Chelicerae and sternum dark brown. Abdomen heavily shaded with blackish brown on the lateral and ventral surface leaving a pale mid-dorsal band broken anteriorly by a short dark median band.

*Carapace* Width of the head equal to 3/5 of the width of the thorax. Lateral margins of the head straight and parallel and extend back 1/3 of the length of the carapace. Fovea relatively long and conspicuous.

*Eyes* Eye region black. The eyegroup is compact and occupies 3/5 of the width of the head. From above the anterior row is straight and the posterior row is slightly procurved. From in front both rows are strongly procurved, with the AME placed at a level between the ALE and PME. Ratio of AME.ALE.PME.PLE = 5.14.12.16. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes separated by a distance equal to 7/5 of the diameter of an AME. PME separated from each other by 11/5 and from the PLE by 9/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 35.15 and wider behind than long in the ratio of 35.29. Height of the clypeus equal to the diameter of an AME.

*Sternum* Longer than wide in the ratio of 13.11. The anterior margin is curved from the margins of the labium and merges with the lateral margins which are also evenly curved. The posterior projection is sharp and separates coxae 4 by a distance equal to one half of the width of a coxa.

*Maxillae* Longer than wide in the ratio of 10.7. The outer margins are gently curved and merge with the anterior margin.

*Labium* Notched at the base. Lateral margins straight and convergent. Anterior margin straight. Wider than long in the ratio of 7.5.

*Chelicerae* Length of the chelicerae equal to one third of the length of the carapace. Retromargin with two teeth. Promargin with seven minute contiguous teeth distally, followed behind by two normal teeth and a low carina which extends back to the base of the chelicera.

*Palp* Spines. Femur, d.0.1.1.1. p.0.0.0.2. Patella, d.1.1. Tibia, p.1.2. d.0.1. Tibia with nine trichobothria arranged 2.2.1.2.2. Claw with six teeth.

| Palp | 0.65     | 0.33    | 0.40  |            | 0.60   | 1.98  |

*Colour* Carapace, legs and sternum shaded with dark brown. Abdomen cream with heavy blackish brown, broken shading on the lateral and ventral surfaces. A dark band extends down one third of the mid-dorsal surface of the abdomen leaving a pale area lateral to, and posterior to, the band.

*Carapace* The width of the head region is equal to one half of the width of the thorax. Lateral margins of the head are divergent and merge with the thorax. Fovea narrow but distinct.

*Eyes* Eye area black. The eyes are relatively large and the group occupies 4/5 of the width of the head. From above the anterior row is straight and the posterior row

is procurved. From in front the AME are seen to be situated at the level between the ALE and PLE with both anterior and posterior row strongly procurved. Ratio of AME.ALE.PME.PLE = 7.11.16.14. AME separated from each other by a distance equal to 4/7 and from the ALE by 7/7 of the diameter of an AME. Lateral eyes separated by 3/7 of the diameter of an AME. PME separated from each other by 7/7 and from the PLE by 8/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 39.18 and wider behind than long in the ratio of 39.35.

*Sternum* As long as wide. Anterior margin straight. Lateral margins evenly curved. Posterior projection short and sharp, separating coxae 4 by a distance equal to one fifth of the width of a coxa.

*Maxillae* Longer than wide in the ratio of 4.3. Inner and outer margins gently curved. Anterior margin broad and straight.

*Labium* Wider than long in the ratio of 7.5. Notched at the base. Lateral margins straight and strongly convergent. Anterior margin straight.

*Chelicerae* One third of the length of the carapace. Both pro- and retromargins with two teeth of which the distal is the larger. A carina is present.

*Palp* Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.d.1.1. Tibia with six trichobothria arranged in three pairs. Claw with four teeth.

*Legs* Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.2.2.1. p.0.1.1. Metatarsus, v.2.2.0. p.0.1.2. r.0.0.2. Second

leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.2.2.1. p.0.1.1. Metatarsus, v.2.2.1. p.2.1.2. r.0.1.2. d.0.1.0. Trichobothria. First and second legs. Tibia, 2.2.2.2. Metatarsus, 3. Tarsus, 5. Third leg. Tibia, 2.2.2.2. Metatarsus and tarsus, 4. Fourth leg. Tibia, 2.2.2.2.1. Metatarsus and tarsus, 4. Superior claws with from eight-nine teeth. Inferior claw with two long teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 194, 195. The anterior and posterior pairs of spinnerets are subequal. The colulus is well developed and clothed with hairs.

**Type** Holotype female. Westland. Kelly's range. Otira, 4,000ft, under stones, 26.i.1956, R. R. Forster (Otago Museum).

#### *Ahua* n.gen.

Small (1.5-2mm in body length) cribellate spiders. Eight eyes in two more or less straight rows. AME very small, remaining eyes subequal. Legs 1423 or 4123, strongly spined. Femora with at least the two basal spines of the mid-dorsal row. Ventral surface of the tibia of the first pair of legs with paired spines, one pair being distal. Metatarsus of the first pair with the distal whorl reduced to two spines. Dorsal surface of the tibiae of the first and second pairs without spines but typical spines present on the third and fourth. Tarsal organ distal to the trichobothria on the legs. Trichobothria few but long. Double row on tibia, single row on metatarsi and tarsi. Superior claws similar, strongly pectinate. Inferior claw with a single tooth. Tarsal organ subdistal. Scopulae, claw tufts and tenent hairs absent. Female palp with a double row of trichobothria on the tibia. Claw strongly pectinate. Chelicerae with boss. Retromargin with two, promargin with from three-five teeth. Epigynum simple, with a triangular plate on the posterior margin. Internal genitalia tubular and convoluted. Cribellum broad with spinning field divided. Calamistrum with from 5-7 hairs, proximal. Anterior pair of spinnerets closely spaced. Male palp with a stout, spinous, evenly curved embolus. Conductor in the form of a strong plate originating from near the base of the embolus. Median apophysis well developed, hooked apically.

**Type species** *Ahua vulgaris* n.sp.

These small spiders have been found in the Canterbury region of the South Island and off Stewart Is., where they live amongst the litter on the forest floor. Their habits are not known. We have concluded, mainly on the form of the male palp, that the genus shows affinity with the *Orepukia-Mahura* complex.

#### *Ahua vulgaris* n.sp.

**Colour** Carapace pale yellow brown with faint black shading down the posterolateral surface of the head region and fainter markings on the thorax. Legs uniform yellow brown. Abdomen cream with scattered black reticulate markings.

**Eyes** The eyegroup is compact and occupies 4/7 of the width of the head. From above both rows appear straight. From in front the anterior row is slightly procurved and the posterior row more strongly procurved. Ratio of AME.ALE.PME.PLE = 2.5.5.4. AME separated from each other by a distance equal to 3/2 of the diameter of an AME. AME, ALE and PLE subcontiguous. PME separated from each other by 4/3 and from the PLE by 2/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 14.7 and wider behind than long in the ratio of 14.9. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Retromargin with two teeth, promargin with five.

**Palp** Spines. Femur, d.0.1.0.0. Patella, d.1.1. Tibia, p.1.0. Tarsus many. Tibia with three trichobothria arranged 2.1. Claw with three teeth.

**Colour** Cephalothorax dark brown, legs paler brown. Abdomen with blackish shading which forms a series of indistinct transverse bands down the dorsal surface.

**Eyes** The eyegroup occupies 5/7 of the width of the head. From above both rows appear straight but from in front both rows appear gently procurved. Ratio of AME.ALE.PME.PLE = 1.4.4.5. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes contiguous. PME separated from each other by three times, and from the PLE by twice, the diameter of an AME. MOQ wider behind than in front in the ratio of 11.3 and wider behind than long in the ratio of 11.7. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Retromargin with two, promargin with three teeth.

**Palp** Apart from a number of small spines on the tarsus there are two spines on the prolateral surface of the tibia. Tibia with two trichobothria in a single row.

**Legs** Spines. First leg. Tibia, v.2.2.0. p.0.0.1. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.0. Tibia, v.1.1.0. p.0.2.0. Metatarsus, v.1.2.1. p.0.1.1. r.0.0.1. d.0.0.1. Trichobothria. Tibia, 1.1. Metatarsus, 1.1.1. Tarsus, 1. Superior claws with six, inferior claws with two teeth.

**Abdomen** The cribellum is narrow and divided. The epigynum is typical (Figs. 206, 207).

**Type** Holotype female Stewart Island. Thule, Patterson Inlet, 31.x.1948, R. K. Dell (Dominion Museum).

**Record** Codfish Island, Sealers Bay, under *Phormium*, 8.xi.1948, R. K. Dell.

#### *Tararua* n.gen.

Medium sized (body length 4-5mm) arboreal spiders, both cribellate and ecribellate. Similar in appearance to *Neoramia* but smaller and paler in colouration. The tibial processes of the male palp are more complex but the epigynum is simple with the lateral spines weakly developed. The internal genitalia is basically receptaculate as in *Neoramia* but the ducts are longer. Prolateral spine present on the femur of the first pair of legs. Full complement of femoral spines usually present on the third pair of legs but basal dorso-lateral spines often wanting on other legs. Tibia of the first pair of legs with paired ventral spines one pair being situated distally. Dorsal spines are present on the dorsal surface of the third and fourth pairs but reduced to bristles on the first and second pairs. The metatarsus of the first pair with a distal whorl of five spines. Tarsal organ distal to trichobothria on the legs. Palpal tarsus without trichobothria.

Type species *Habronestes celeripes* Urquhart.

These active spiders are usually beaten from low shrubs in forest or alpine scrub. Although some species may make a small snare it is thought that they are primarily active hunters. Some species appear to be cribellate but others with a reduced calamistrum may not have a functional cribellum. In some species both cribellum and calamistrum are definitely lacking.

| Palp | 0.50     | 0.30    |             | 0.33        |            | 0.60 | 1.73  |

**Colour** Fig. 210 shows a preserved specimen. The palest areas are white and apart from the dark markings shown the rest is yellow. In life the mid dorsal area of the head is pale with white hairs, the lateral surfaces of

the thorax pale yellow with dark markings and the rest of the carapace dark with the eyes on black spots. On the abdomen the pale folium is bright green, flanked on each side by several spots formed by white hairs set in black bands. White hairs form a ring which encloses a dark area on the mid anterior surface. This ring is followed by a prominent chevron also formed by white hairs which is the anterior border of the bright green folium. There is a sprinkling of white hairs on the lateral surfaces of the abdomen. The legs are pale yellow green with dark bands.

**Carapace** The profile forms a regular curve from petiolus to the PME with the highest point being just anterior to the fovea which is longitudinal and of moderate length and depth. The head is three-quarters the width of the thorax.

**Eyes** The group occupies about 7/10 of the width of the head. From in front the anterior row is slightly procurved and from above the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 3.5.6.7. AME separated from each other and from the ALE by a distance equal to 4/3 of the diameter of an AME. Laterals separated by 2/3 of the diameter of an AME. PME separated from each other by 5/3 and from the PLE by 9/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 17.10 and as wide behind as long. Height of the clypeus equal to 7/3 of the diameter of an AME.

**Sternum** Longer than wide in the ratio of 52.48. Broadly scutiform. A blunt posterior projection separates the posterior coxae by 5/6 of the diameter of a coxa.

**Maxillae** Inclined slightly over the labium. Longer than wide in the ratio of 25.17 and longer than the labium in the ratio of 25.15.

**Labium** Wider than long in the ratio of 16.15. There are small notches at the base and it is emarginate distally.

**Chelicerae** Length 5/12 of the carapace. A prominent boss is present. There are two teeth on the retromargin, three, of which the median is the largest, on the promargin and a carina which extends to the base.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.1.1. p.1 basal and 1.1 distal. r.1 distal. Numerous spines on the tarsus. Trichobothria. Tibia, two rows each with three. Claw with 12 teeth.

**Legs** Spines. First leg. Femur, a prolateral spine is present, d.1.1.1. p.r.0.1. Patella, d.1.1. Tibia, v.0.2.2. p.1.1.1. r.0.1.1. d.1.1. Metatarsus. v.2.2 and a subwhorl of 5, p.r. 1 median. Patella, d.1.1. Tibia, v.0.1.2. p.r.d.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.1.2. r.1.1. Fourth leg. Femur, d.1.1.1. p.r.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.r.d.1.1. Metatarsus v.3.2. and a subwhorl of 5, p.1.1. r.1 calamistrum 1. The p.r.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.r.d.1.1. Metatarsus, v.3.2 and a subwhorl of 5, p.1.1. r.1 calamistrum 1. The calamistrum is composed of six setae and occupies about one quarter of the length of the metatarsus. Trichobothria. First leg. Tibia, a pro-row 1.1.1.1 on the basal third, a retro-row 1.1.1.1 extending to beyond the midpoint. Metatarsus, 1.1.1. Tarsus, 1.1.1.1. The distal trichobothrium is situated at 38/55 of the length of the tarsus and the tarsal organ at 45/55. Second leg. Tibia, p.1.1. r.1.1.1.1. Metatarsus, 3. Tarsus, 4. Third and fourth legs. Tibia, p.1.1.1.1. r.1.1.1.1. Metatarsus and tarsus, 4. Superior claws of a first leg with 14 teeth and 11 on the claw of a fourth leg.

**Abdomen** Surfaces well covered with hair of various lengths. The cribellum is divided but the spinning field, if any, is very small. The epigynum and internal genitalia are shown in Figs. 213, 215.

##### Measurements

| Leg  | Carapace |         | length 2.13 |             | width 1.43 |      | Total |
|------|----------|---------|-------------|-------------|------------|------|-------|
|      | Femur    | Patella | Abdomen     | length 2.17 | width 1.27 |      |       |
| 1    | 2.10     | 0.60    |             | 2.23        | 2.17       | 0.83 | 7.93  |
| 2    | 1.93     | 0.63    |             | 1.67        | 1.73       | 0.80 | 6.76  |
| 3    | 1.67     | 0.60    |             | 1.40        | 1.60       | 0.70 | 5.97  |
| 4    | 1.93     | 0.60    |             | 1.60        | 1.87       | 0.73 | 6.73  |
| Palp | 0.60     | 0.30    |             | 0.30        |            | 0.70 | 1.90  |

**Colour** Resembles the female.

**Eyes** The group occupies about 2/3 of the width of the head. From in front the anterior row is slightly procurved. Ratio of AME.ALE.PME.PLE = 3.4.6.7. AME separated from each other and from the ALE by a distance equal to 4/3 of the diameter of an AME. Laterals separated by 2/3 of the diameter of an AME. PME separated from each other by 5/3 and from the PLE by 7/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 17.10 and as wide behind as long. Height of the clypeus is equal to 10/3 of the diameter of an AME.

**Palp** The tibial processes and the bulb are shown in Figs. 211, 212.

**Legs** 1243. Spination resembles that of the female. No calamistrum.

**Abdomen** The cribellum is represented by a relatively large conical colulus.

**Types** Mount Egmont, Urquhart. Male and female types lost.

**Records** Taranaki, Mt Egmont, above Stratford House, 3,500 ft, 23.iii.1969, R.R.F., C.L.W., beaten from shrubs.

| 4    | 1.26     | 0.54    |             | 1.08        | 1.20       | 0.66 | 4.74  |
| Palp | 0.54     | 0.30    |             | 0.36        |            | 0.60 | 1.80  |

**Colour** The head region of the carapace is shaded with blackish brown while the thoracic region is pale yellow brown. Legs pale yellow with small scattered brown patches. Abdomen grey with a pale median band flanked with black shading.

**Eyes** The eyegroup occupies 11/16 of the width of the head. From above the posterior row is straight and the anterior row is gently recurved. From in front the anterior row is straight and the posterior row gently procurved. Ratio of AME.ALE.PME.PLE = 5.6.8.11. AME separated from each other by 3/5 and from the ALE by 5/5 of the diameter of an AME. Laterals separated from each other by 2/5 of the diameter of an AME. PME separated from each other by 9/5 and from the PLE by 11/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 25.13 and wider behind than long in the ratio of 25.21. Height of the clypeus equal to 3/5 of the diameter of an AME.

**Chelicerae** Lateral bosses present as ridges. Retro-margin with two, promargin with three teeth.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.0. Tibia, p.1.2. d.1.2. Tarsus, p.2.1.1. r.1.1.1. Six trichobothria present on the tibia arranged 1.2.2.1. Tarsal claw with ten teeth.

**Legs** The calamistrum consists of a short row of five hairs on the proximal surface of the metatarsus. Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.2. Tibia, v.0.2.2. p.1.1.1. r.0.0.1. Metatarsus, v.2.1.1. p.r.0.1.1. d.0.0.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.2.2.2. p.r.0.1.1. Metatarsus, v.2.2.2. p.r.0.1.1. d.0.0.2. Trichobothria. First leg. Tibia, 2. Metatarsus, 3. Tarsus, 0. Second leg. Tibia, 1.1.2. Metatarsus, 4. Tarsus, 3. Third leg. Tibia, 2.2.1. Metatarsus and Tarsus, 3. Fourth leg. Tibia, 2.1.1. Metatarsus, 4. Tarsus, 3. Tarsal organ at 3/4 of the length of the tarsi. Superior claws with 12, inferior claw with a single tooth.

**Abdomen** The cribellum is small, sub-triangular in shape. The epigynum and internal genitalia are shown in Figs. 218, 219.

|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | width |            |        |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 2.90     | 0.88    | 3.02  | 3.02       | 1.13   | 10.95 |
| 2    | 2.39     | 0.82    | 2.14  | 2.33       | 1.01   | 8.69  |
| 3    | 2.08     | 0.76    | 1.64  | 2.02       | 0.76   | 7.26  |
| 4    | 2.27     | 0.69    | 1.89  | 2.21       | 0.88   | 7.94  |
| Palp | 0.76     | 0.40    | 0.32  |            | 0.96   | 2.44  |

**Colour** The head region and the median surface of the thoracic region is dark reddish-brown. The margins of the thoracic region are paler. Chelicera dark, almost black. Legs orange brown. The abdomen is yellow brown with darker shading on the lateral surfaces. There are a pair of large brown patches on the mid-dorsal surface followed behind by two or three indistinct dark chevrons. Sternum yellow brown with dark brown shading along the margins.

**Eyes** The eyegroup occupies 11/15 of the width of the head. Lateral eyes on a low tubercle. From above both rows appear straight but from in front the anterior row appears straight but the posterior row is slightly procurved. The ratio of AME.ALE.PME.PLE = 11.13.14.15. AME separated from each other by a distance equal to 8/11 and from the ALE by 9/11 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 15/11 and from the PLE by 10/11 of the diameter of an AME. MOQ wider behind than in front in the ratio of 43.30 and wider behind than long in the ratio of 43.40. Height of the clypeus is equal to 8/11 of the diameter of an AME.

**Chelicerae** Equal to 5/13 of the length of the carapace. Retromargin with a single tooth. Promargin with three teeth and a carina which extends to the base of the chelicerae.

**Palp** Tibia with a very strong prolateral process which is distally roughened (Fig. 220). Bulb as in Fig. 221.

**Legs** Clothed with numerous long, slender and smooth hairs and further smaller serrate and plumose hairs. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. r.0.0.0.1. Tibia, v.1.1.2. p.1.1.1. r.0.1.1. Metatarsus, v.2.2.1. p.0.1.2. Second leg. Femur, d.0.1.1.1. p.0.1.0.1. r.0.0.0.1. Tibia, v.1.2.2. p.r.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. d.0.1.0. Trichobothria. Tibia, 2.2.1.1. Metatarsus and tarsus, 4. Superior claws with from 14-16 teeth. Inferior claw with two teeth. Calamistrum lacking.

**Abdomen** The posterior pair of spinnerets are more slender than the anterior pair but approximately equal in length. The cribellum is small and pointed posteriorly. The spinning area is small and may be non-functional.

**Type** Holotype male. Nelson. Salisbury Opening, Mt Arthur Tableland, 23.i.1948, R. R. Forster (Dominion Museum).

| 3    | 1.20     | 0.55    | 0.85  | 1.00       | 0.60   | 4.20  |
| 4    | 1.40     | 0.60    | 1.08  | 1.28       | 0.65   | 5.01  |
| Palp | 0.58     | 0.30    | 0.38  |            | 0.63   | 1.89  |

*Colour* Head and median surface of the thorax bright orange-brown, remaining surface of the thorax cream. Chelicerae reddish brown. Legs yellow-brown. Abdomen yellow brown with a few faint markings on the dorsal surface.

*Eyes* The eyegroup occupies 2/3 of the width of the head. From above both rows are straight but from in front the anterior row is straight and the posterior row is strongly procurved. Ratio of AME.ALE.PME.PLE = 7.9.10.15. AME separated from each other by a distance equal to 7/7 and from the ALE by 9/7 of the diameter of an AME. Lateral eyes separated by a distance equal to 5/7 of the diameter of an AME. PME separated from each other by 15/7 and from the PLE by 19/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 35.21 and longer than wide behind in the ratio of 37.35. Height of clypeus equal to twice the diameter of an AME.

*Chelicerae* Length equal to 11/29 of carapace. Retro-margin with two teeth. Promargin with three teeth, of which the median is largest. A carina is present.

*Palp* Spines. Femur, d.0.1.1.1. Tibia, p.1.2. d.1.0. Six trichobothria are present on the tibia arranged in three pairs. Tarsal organ distal. Claw with ten teeth.

*Legs* Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.0.2.2. p.1.0.1. Metatarsus, v.2.2.1. p.1.0.2. r.0.0.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.0.1. Tibia, v.0.1.2. p.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. Trichobothria. Tibia, 1.2.2.1.1. Metatarsus and tarsus, 3. There are a few hairs on the metatarsus of the fourth leg which could be the vestiges of a calamistrum but a true calamistrum is not present. Superior claws with from 15-16 teeth. Inferior claws of legs 1 and 2 with two teeth, legs 3 and 4 with a single tooth.

*Abdomen* The epigynum and internal genitalia are shown in Figs. 226, 227. The anterior and posterior pairs of spinnerets are of approximately equal length. The cribellum is small and appears to be non functional.

*Type* Holotype female. Fiordland, Caswell Sound, 15.iv.1949, R. R. Forster (Otago Museum).

*Records* Fiordland. Thompson Sound, sea level, 14.i.1958, R.R.F.

#### Measurements

| Carapace | length | width |
|----------|--------|-------|
| Abdomen  | length | width |
|          | 1.84   | 1.40  |
|          | 1.76   | 1.21  |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 1.88  | 0.63    | 1.78  | 1.70       | 0.70   | 6.69  |
| 2    | 1.75  | 0.63    | 1.50  | 1.43       | 0.75   | 6.06  |
| 3    | 1.55  | 0.55    | 1.20  | 1.25       | 0.60   | 5.15  |
| 4    | 1.63  | 0.55    | 1.38  | 1.45       | 0.65   | 5.66  |
| Palp | 0.80  | 0.24    | 0.20  |            | 0.68   | 1.92  |

*Colour* Head and median surface of the thorax dark orange brown. Margins of the thorax paler yellow brown. Legs yellow with dark bands. Abdomen pale on the mid-dorsal surface and the ventral surfaces but lateral surfaces and an area in front of the spinnerets and behind the epigastric groove on the ventral surface heavily pigmented with black.

*Eyes* The eyegroup occupies 9/11 of the width of the head. From above the anterior row is straight and the posterior row is slightly procurved. From in front the anterior row is straight and the posterior row is more strongly procurved. Ratio of AME.ALE.PME.PLE = 7.10.10.12. AME separated from each other by a distance equal to 8/7 and from the ALE by 9/7 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 13/7 and from the PLE by 15/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 33.22 and wider behind than long in the ratio of 33.32. Height of the clypeus equal to 12/7 of the diameter of an AME.

*Chelicerae* Length equal to 4/9 of the length of the carapace. Retromargin with two teeth. Promargin with three teeth of which the distal is the smallest and the proximal is fused to the carina which extends to the base of the chelicera.

*Palp* As in Figs. 230, 231. The tibial processes are relatively small.

*Legs* 2314. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, v.0.0.2. p.0.1.1. r.0.1.1. d.1.1.0. Metatarsus, v.2.2.1. p.r.0.1.2. d.1.0.1. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, v.0.0.2. p.r.0.1.1. d.1.1.0. Metatarsus, v.2.2.1. p.r.0.1.2. d.0.1.0. Trichobothria. Tibia, 1.1.2.1.1.1. Metatarsus and tarsus, 3. Superior claws with from 11-12 teeth. Inferior claw with a single tooth. Calamistrum absent.

*Abdomen* The anterior pair of spinnerets are slightly longer than the posterior pair. The colulus is wide, four times as wide as long.

The general appearance and structure is similar to the female. The proportional size and disposition of the eyes is slightly different. Ratio of AME.ALE.PME.PLE = 8.13.9.14. AME separated from each other by a distance equal to 8/8 and from the ALE by 7/8 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 15/8 and from the PLE by 11/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 33.24 and longer than wide behind in the ratio of 34.33. Height of the clypeus equal to 7/8 of the diameter of an AME.

**Legs** The spination and number of trichobothria differs. Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. r.0.0.0.1. Patella, d.0.1. Tibia, v.0.1.2. p.1.1.1. r.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.2. Patella, d.1.1. Tibia, v.0.1.2. p.r.0.1.1. d.1.0.0. Metatarsus, v.2.2.1. p.r.1.1.2. Trichobothria. First leg. Tibia, 1.1.2. Metatarsus, 4. Tarsus, 6. Remaining legs. Tibia, 1.2.1.1.1.1. Metatarsus and tarsus, 4. Superior claws with from 11-12 teeth. Inferior claw with three teeth. The palp is shown in Figs. 232, 233. The conductor is large and the distal portion is membranous and cupped. The cribellum is broad, twice as long as wide. The spinning area is small and probably non-functional but appears to be divided. Calamistrum not been seen.

**Type** Holotype female. Waikaremoana, Panikiri Track, foliage, 11.xii.1946, R. R. Forster. Allotype male. Panikiri Track, foliage, 11.xii.1946, R. R. Forster (Dominion Museum).

**Records** Waikari-iti, on foliage, 14.xii.1946, R.R.F. Panikiri Track, Waikaremoana, on foliage, 11.xii.1946, R.R.F.

## Huka n.gen.

Minute (body length 1-1.5mm) cribellate spiders. Usually lacking pigment. Eyes in two, more or less straight, rows. AME very small. Remaining eyes subequal. PME well separated. Legs 4123, few or no spines on the first two pairs of legs. Femora of the third and fourth pairs of legs with one basal spine. There are no dorsal tibial spines.

Trichobothria few but long. Double row on the tibiae and only one or two in a single row on the metatarsi and tarsi Tarsal organ subdistal. Superior claws similar and strongly pectinate. Inferior claw smooth or with few teeth. Scopulae, claw tufts, and tenent hairs lacking. Chelicerae with boss. Retromargin with two and pro-marginal with from two-five teeth. Female palp with a double row of trichobothria on the tibia. Claw smooth. Internal genitalia simple; receptaculate. Cribellum well developed, broad, usually three times as wide as long. Spinning fields divided. Calamistrum consisting of from 5-6 hairs on the proximal half of the metatarsus. Male palp with strong, usually spinous embolus, slightly curved. Median apophysis well developed, digitate. Conductor consisting of a translucent membranous structure supporting the distal portion of the embolus.

Type species *Huka pallida* n.sp.

These minute unpigmented spiders live amongst moss and detritus on the forest floor. They are usually collected from Berlese samples and little

is known of their habits. It is probable that they do not construct snares but this is not certain. When found they are usually present in large numbers but males are rarely found. Mature females have been collected in all seasons but it is not known whether the breeding cycle is continuous of whether the spiders are relatively long lived.

The relationships of this genus are not clear but we have associated it with the *Oramia* group of genera.

**Colour** Cephalothorax and appendages pale yellow. Abdomen cream.

**Eyes** The eyegroup is compact and occupies half of the width of the head. From above both rows appear straight. From in front the posterior row appears straight but the anterior is slightly procurved. Ratio of AME.ALE. PME.PLE = 1.2.2.2. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes contiguous. PME contiguous with the PLE and separated from each other by a distance equal to twice the diameter of an AME. MOQ wider behind than in front in the ratio of 6.3, and wider behind than long in the ratio of 6.5. Height of clypeus equal to three times the diameter of an AME.

**Sternum** Scutiform. Anterior margin straight, lateral margins evenly curved. Wider than long in the ratio of 7.6. Coxae 4 separated by a distance equal to the width of a coxa.

**Maxillae** Convergent. Lateral margins straight, anterior margin evenly rounded. Twice as long as wide.

**Labium** Evenly rounded, twice as wide as long.

**Chelicerae** Short, vertical, with boss. Retromargin with two teeth. Promargin with three teeth of which the proximal is large and apically bifid.

**Palp** Apart from numerous spines on the tarsus the only spines are two on the prolateral surface of the tibia. There are three trichobothria on the tibia arranged 2.1. The claw is provided with seven small teeth.

**Legs** Spines are present only on the third and fourth pairs of legs. Third leg. Femur, d.0.1.0.0. Patella, d.0.1. Tibia, v.0.0.1. p.r.0.1.0. Metatarsus, v.p.r.0.0.1. Fourth leg. Femur, d.0.1.0.0. Patella, d.0.1. Tibia, v.0.1.2. r.0.1.1. Metatarsus, v.p.r.0.0.1. d. 0.1.0. Trichobothria. First three pair of legs. Tibia, 2.1.1. Metatarsus and tarsus, 1.1. Fourth leg. Tibia, 2.2.1. Metatarsus, 1.1. Tarsus, 1. Calamistrum of six hairs occupies half of the length of the metatarsus. Superior claws provided with seven teeth, inferior claw with one tooth. Tarsal organ present on all tarsi at 2/3 of the length of the segment.

**Abdomen** The epigynum is provided with a pair of curved spines on the posterior margin (Fig. 238). The internal genitalia are simple (Fig. 239). The cribellum is small and divided.

Similar to female. Spines. First leg. Tibia, v.0.2.0. Metatarsus, v.0.2.0. Second leg. Femur, d.0.1.0.0. Tibia, v.0.1.0. Metatarsus, v.0.1.1. Third leg. Femur, d.0.1.1.0. Patella, d.0.1. Tibia, v.0.1.2. p,r.0.1.0. Metatarsus, v,p,r.0.1.1. Fourth leg. Femur, d.1.0.0.0. Tibia, v.0.1.2. r.1.1.0. Metatarsus, v.0.1.1. p.0.1.2. r.0.0.2. d.0.1.0. The male palp is illustrated in Figs. 250, 251.

**Types** Holotype female, allotype male. Raetihi, leaf litter, 23.xii.1948, R. R. Forster (Otago Museum).

**Records** North Island. Same data as types. Ohakune, north road, leaf litter, 5.i.1965, B. A. Holloway. South Island. Fiordland. Homer, 3,000 ft, moss, 9.ii.1955, R.R.F. Homer, 16.ii.1966, R.R.F. Cascade Creek, Eglinton Valley, moss, 6.iii.1966, R.R.F. Cascade Creek, 13.ii.1955, R.R.F. Manapouri, 23.i.1951, R.R.F.

This species is close to *pallida* but is readily separated by the form of the male palp and the female epigynum. The distribution of this species is most unusual for a cryptozoic spider, being found in both Fiordland and the central North Island districts but apparently not in between. With the extensive sampling of forest floor fauna it is probable that this distribution is real and not the result of inadequate sampling of the intervening areas.

**Colour** Cephalothorax and legs pale straw yellow. The abdomen is however heavily coloured with black pigment.

**Eyes** The eyes are ringed with black. From above both rows are almost straight. The eyegroup occupies two thirds of the width of the head. The ratio of AME.ALE.PME.PLE = 1.5.4.5. The AME are separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes separated from each other by a similar distance. The PME are separated from each other by a distance equal to four times and from the PLE by twice the diameter of an AME. MOQ four times wider behind than in front and three times longer than wide in front. Width of the clypeus twice the diameter of an AME.

**Sternum** Oval in outline. Longer than wide in the ratio of 20.17. Broadly pointed behind where coxae 4 are separated by the width of a coxa.

**Chelicerae** Retromargin with two and promargin with three teeth.

**Legs** Spines absent from the first three pairs of legs. Fourth leg with a pair of weak spines on the distal ventral surface of the metatarsus. Trichobothria. Legs 1 and 2. Tibia, 1.2.1.1. Metatarsus, 1.1. Tarsus 1. Legs 3 and 4. Tibia, 1.2.1.1. Metatarsus, 1.1. Tarsus, 1. Superior claws with ten teeth. Inferior claw with a single tooth. Tarsal organ at three-quarters of the length of the segment. Calamistrum with six hairs, on the proximal half of the metatarsus.

**Palp** Spines on tarsus. Claw smooth. Three trichobothria in a double row on the tibia.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 248, 249. The cribellum is broad, three times as wide as long. Anterior pair of spinnerets widely spaced.

**Type** Holotype female. North Island. Taumarunui, Owanga, 22.vi.1967, C. L. Wilton (Otago Museum).

**Colour** Cephalothorax and legs pale straw yellow, abdomen cream.

**Eyes** From above anterior row straight and posterior row gently procurved. Ratio of AME.ALE.PME.PLE = 2.4.3.4. AME separated from each other and from the ALE by a distance equal to the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by two and a half and from the PLE by a distance equal to the diameter of an AME. MOQ wider behind than in front in the ratio of 11.6 and longer than wide in the front in the ratio of 8.6.

**Sternum** Longer than wide in the ratio of 7.6. Broadly obtuse behind where the coxae are separated by a distance equal to the width of a coxa.

*Chelicerae* Two teeth on each margin.

*Legs* Spines absent from leg 1. Second leg. Femur, d.1.0.0. Tibia, v.0.1.0. Metatarsus, v.0.2.1. Third leg. Femur, d.1.0.0. Tibia, v.0.1.2. Metatarsus, v.0.1.1. d.0.0.1. Fourth leg. Femur, d.1.1.0. Tibia, v.1.1.2. p.0.1.0. r.0.1.1. Metatarsus, v.p.r.0.1.1. Trichobothria. Legs 1 and 2. Tibia, 1.2.1.1. Metatarsus and tarsus, 2. Legs 3 and 4. Tibia, 1.2.1. Metatarsus and tarsus, 2. Superior claws with ten teeth. Inferior claw smooth. Tarsal organ at three-quarters of the length of the tarsus. Calamistrum proximal, with six hairs.

*Abdomen* Epigynum and internal genitalia as shown in Figs. 244, 245. Anterior pair of spinnerets widely separate. Cribellum three times as wide as long, notched on the mid-posterior surface. Spinning field small, divided.

*Type* Holotype female. Wairarapa, Mangareia, 28.vii.1947, C. L. Wilton (Otago Museum).

*Records* Mangareia, 5.i.1947, C.L.W. West Taupo, 4.xi.1953, R. K. Dell. Brothers Is., Cook Strait, near bird nests, 12.v.1956, G. W. Ramsay. Waihothonu Stream, east side of Ruapehu, 17.i.1967, K. A. J. Wise. White Is., Ohauora, leaf litter, 6.xii.1966, K. A. J. Wise.

*Oramiella* n.gen.

Similar to *Neoramia* in most characteristics but with some trichobothria distal to the tarsal organ on the legs. Type species *Oramiella wisei* n.sp.

This relatively small spider seems to be a northern derivative of *Neoramia*. The male palp suggest that it may be an outlier of the *fiordensis* group which otherwise is typically southern in distribution.

| Palp | 0.9   | 0.35    | 0.35  |            | 0.8    | 2.4   |

*Colour* Head region yellowish brown with a slight orange tinge especially near the front margins. There are dark veinlike markings which become very broad posteriorly. The thoracic region is very pale except for a longitudinal band of cephalic colouring which extends down the steep posterior slope to the petiolus. Chelicerae dark brown. Legs pale, tinged with orange and with dark bands. Sternum pale, almost white, with very pale olive margins. Maxillae and labium pale brown with white apices. On the mid-anterior dorsal surface of the abdomen is a pale area which also forms the extremities of a St. Andrew's cross. This area is bordered on each side by a rather heavy black band. Outside of these bands and extending posteriorly are paler areas which are liberally flecked with black. The rest of the dorsal and lateral surfaces more or less dark. The ventral surface of the abdomen is pale with a dark area on each side near, but not touching, the mid-lateral margins.

*Carapace* The width of the head is three-quarters of the width of the thorax. There are a few long hairs scattered over the head and only short hairs on the thorax where they are confined chiefly to the lateral angles of the steep hind slope and along the lateral margins.

*Eyes* The group occupies about 2/3 of the width of the head. From in front the anterior row is very slightly procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 9.12.11.11. AME separated from each other by a distance equal to 9/9 and from the ALE by 10/9 of the diameter of an AME. Laterals separated by 5/9 of the diameter of an AME. PME separated from each other by 12/9 and from the PLE by 17/9 of the diameter of an AME. MOQ wider behind than in front in the ratio of 33.27 and longer than wide behind in the ratio of 40.33. Height of the clypeus equal to 15/9 of the diameter of an AME.

*Sternum* Longer than wide in the ratio of 45.35. Scutiform. Posterior projection separates the posterior coxae by half the diameter of a coxa.

*Maxillae* Inclined slightly over labium, twice as long as wide and longer than the labium in the ratio of 36.19.

*Labium* As long as its greatest width, notched at the base and with the distal margin emarginate.

*Chelicerae* Length 9/20 of the carapace. Promargin of the groove with three teeth, the median being the largest, and the retromargin with two well separated small teeth. A basal carina terminated distally as the first tooth of the three on the promargin.

*Palp* The tibial processes and the distal portion of the bulb are shown in Figs. 255-256.

*Legs* Spines. First leg. Femur, a prolateral spine is present, d.1.1.1. p.r.0.1. Tibia, v.0.2.2. p.1.1.1. r.0.1.1. Metatarsus, v.2 and a subwhorl of 5, p.r.1 median. Second leg. Femur, d.1.1.1. p.1.1. r.0.1. Tibia, v.1.2.2. p.r.0.1.1. Metatarsus, same as the first leg. Third leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.0.2.2. p.r.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.r.1.1. Fourth leg. Femur, d.1.1.1. p.r.0.1. Tibia, v.1.2.2. p.r.1.1. Metatarsus, 2.2 and a subwhorl of 5, p.1.1. r.1 calamistrum 1. Calamistrum a single row occupying one-third of the length of the segment. Trichobothria in two rows on the tibiae. Metatarsi and tarsi, 4. The tarsal organ is situated between the fourth and fifth trichobothria from the base of the tarsus. Superior claws with 11 teeth and inferior claw two.

*Abdomen* There is a divided functional cribellum.

*Type* Holotype male. North Auckland. Moss on tree. Sample 294. North of Maungaturoto, 9.vii.1967, K. A. J. Wise (Auckland Museum).

*Oramia* Forster 1964

- 1899 *Amaurobius* (in part), Simon. Zool. Jahrb. Syst. 12: 433.  
1909 *Amaurobius* (in part), Hogg. Subantarctic Is. N. Zeal. 1: 159.  
1917 *Ixeuticus* (in part), Dalmas. Ann. Soc. Ent. France. 86: 334.  
1964 *Oramia*, Forster. Pacific. Ins. Mon. 7: 59.

These large (body length 8-15mm) cribellate spiders are separated from those placed in *Neoramia* mainly on genitalic characters. The embolus is flattened and twisted rather than simply spiniform. The ducts leading from the receptacula are longer and more closely resemble those found in *Tararua*. The ducts open anteriorly on the epigynum which is provided with a pair of small spines. The habits of these spiders are quite different from *Neoramia*. Most of the species recorded live in the spray-zone on shingle beaches where they construct small snares amongst the stones. They appear to feed mainly on amphipods and kelp flies. The egg sac, a large spherical white sac, is placed within the snare.

*Colour* Head region of carapace reddish brown becoming darker anteriorly and laterally and the thoracic region reddish yellow. Chelicerae very dark reddish brown with the bosses lighter in shade. Legs brownish yellow shading to red at the distal margins of the segments and with dark bands on the femora, where it is confined to the ventral and lateral surfaces. Sternum yellowish brown becoming dark brown at the margins. Maxillary lobes and labium dark brown with white apices. Abdomen pale brownish grey. On the mid-dorsal surface are two short longitudinal dark bands one on each side of the muscle-spot area which are followed by rather obscure chevrons. Elsewhere the surface is with dark flecks. The ventral surface is paler with indications of two dark bands directed posteriorly from the epigastric furrow.

*Carapace* The width of the head is about 7/8 of the greatest width.

*Eyes* The group occupies 3/5 of the width of the head. From in front the anterior row is straight by the lower margins of the eyes and from above the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 10.14.13.15. AME separated from each other by a distance equal to 15/10 and from the ALE by 24/10 of the diameter of an AME. Lateral eyes separated by half the diameter of an AME. PME separated from each by 22/10 and from the PLE by 25/10 of the diameter of an AME. MOQ wider behind than in front in the ratio of 46.35 and longer than wide behind in the ratio of 53.46. Height of clypeus 25/10 the diameter of an AME.

*Sternum* Longer than wide in the ratio of 10.7. Anterior margins straight and lateral margins sinuate. The posterior projection separates the posterior coxae by half the diameter of a coxa.

*Maxillae* Longer than their greatest width in the ratio of 11.6 and longer than the labium in the ratio of 11.7. Inclined slightly over the labium.

*Labium* Longer than wide in the ratio of 7.5, notched at the base and widest just above the notches but reducing to almost half the width distally.

*Chelicerae* Viewed laterally longer than wide in the ratio of 45.37. Two teeth on retromargin, three on promargin. Teeth on the promargin typical but the teeth on the retromargin are even in size and relatively well separated.

*Palp* Spines. Femur, d.1.1.1 on the distal half. Patella, d.1.1. Tibia and tarsus with numerous spines and bristles. There are two rows of trichobothria on the tibia, a pro-

row of six and a retro-row of five. The tarsal claw has about ten teeth.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.1.1. Patella, d.1.2 (bristles). Tibia, v.0.2.2. p.r.0. Metatarsus, v.2.2 and a subwhorl of 3, p.r.0. Second leg. Femur, d.1.1.1. p.r.1.1. Patella, d.1.2 (bristles). Tibia, v.2.2.2. p.0.1.1. r.0. Metatarsus, v.2.2 and a subwhorl of 5, p.1 (median). r.0. Metatarsus, v.2.2 and a subwhorl of 5, p.1 (median) r.0. Third leg. Femur, d.1.1.1. p.r.1.1. Patella, d.1.1 (bristles). Tibia, v.2.2.2. p.r.0.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.1.2. r.1.1. Tarsus, v.1.1 (distal). Fourth leg. Femur, d.1.1.1. p.1.1. r.0.1. Tibia, v.2.2.2. p.r.0.1.1. r.0. Metatarsus, v.3.2 and a subwhorl of 5, p.1.2. r.1. calamistrum. 1. Tarsus, v.1.2 (distal). Trichobothria. Tibia, a pro-row of 1.2.1.1 situated on the basal quarter and a retro-row of 7 extending to the midpoint. Metatarsus, 7. Tarsus, 8. Tarsal organ subdistal. Superior claws of the anterior pairs of legs have about 13 teeth. Posterior pairs with 10 teeth. Interior claw of all legs with two teeth. The calamistrum occupies slightly less than a third of the length of the segment.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 257, 258.

#### MALE

##### Measurements

|          |            |           |
|----------|------------|-----------|
| Carapace | length 6.5 | width 4.4 |
| Abdomen  | length 7.0 | width 4.4 |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 6.2   | 2.4     | 6.7   | 6.9        | 2.6    | 24.8  |
| 2    | 5.7   | 2.3     | 5.4   | 5.4        | 2.1    | 20.9  |
| 3    | 4.9   | 2.0     | 4.2   | 4.7        | 1.9    | 17.7  |
| 4    | 5.5   | 2.2     | 4.8   | 5.2        | 2.1    | 19.8  |
| Palp | 2.6   | 0.9     | 1.2   |            | 2.1    | 6.8   |

**Colour** Resembles the female.

**Eyes** From in front the anterior row is very slightly procurved. Ratio of AME.ALE.PME.PLE = 7.10.9.11. AME separated from each by a distance equal to 10/7 and from the PLE by 12/7 of the diameter of an AME. Lateral eyes separated from each other by 4/7 of the diameter of an AME. PME separated from each other by 15/7 and from the PLE by 20/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 33.24 and longer than wide behind in the ratio of 35.33. Height of clypeus equal to 15/7 of the diameter of an AME.

**Palp** Tibial processes and the distal portion of the bulb are shown in Figs. 259, 260. There are two rows of trichobothria, each with five, on the dorsal surface of the tibia.

**Legs** The spination and claws resemble those of the female.

| 4    | 3.39     | 1.40        | 2.88       | 3.19       |
| Palp | 1.60     | 0.56        | 0.48       | 1.14       |
|      |          |             |            | 1.29       |
|      |          |             |            | 4.08       |

**Colour** Typical with the carapace reddish brown, darkening in front around the eyes.

**Eyes** The eyegroup occupies 2/3 of the width of the head. From above the anterior row is straight and the posterior row is gently procurved. Ratio of AME.ALE.PME.PLE = 3.5.4.5. AME separated from each other by 4/3 and from the ALE by 6/3 of the diameter of an AME. Lateral eyes subcontiguous, being separated from each other by a distance slightly less than the diameter of an AME. PME separated from each other by 7/4 and from the PLE by 9/4 of the diameter of an AME. MOQ wider behind than in front in the ratio of 15.10 and wider behind than long in the ratio of 15.13.

**Chelicerae** Two teeth on the retromargin and three on the promargin.

**Legs** Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.2. Tibia, v.0.2.2. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.1.0.1. Tibia, v.0.2.2. p.0.0.1. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.2. Trichobothria. Tibia, 1.2.1. Metatarsus, 4. Tarsus, 6. The calamistrum occupies the proximal third of the fourth metatarsus.

**Palp** As in Figs. 263, 264.

**Abdomen** The cribellum is small and divided.

#### FEMALE

Similar to the male in most characters. The epigynum and internal genitalia are illustrated in Figs. 261, 262.

**Types** Holotype female. Chatham Islands (Museum d'Histoire Naturelle, Paris).

**Records** Kaiangaroa, 24.xii.1923 (det. Berland). Wangamanoa Hill, bush, 700 ft, 28.i.1924 (det. Berland). Okawa, in kelp bed at high water mark, 28.i.1954, E. W. Dawson. Kaiangaroa, 28.i.1954, R.R.F. South East Is., 2-3.ii.1954, E. W. Dawson. South East Is., 2.ii.1954, R.R.F. Wharekauri, 14.xii.1923, G. Archey. Plateau Bush, Owenga, 3.i.1924, G. Archey.

According to the data with specimens collected by Archey, these spiders were found living inland away from the beach. One of us (R.R.F.) after extensive collecting in the Chatham Islands recorded them only from the area immediately above high tide level.

| Palp | 1.15     | 0.44    | 0.88   |            | 1.21   |       | 3.64  |

Figs. 265-268 *Oramia marplei* Forster. Fig. 265 Epigynum. Fig. 266 Internal genitalia. Fig. 267 Tibial processes of male palp. Fig. 268 Distal portion of male bulb.

**Colour** Carapace orange-brown, darkening to reddish brown anteriorly. Abdomen dark-brown with paler areas on the anterior dorsal surface, expanding into a chevron about midway, followed behind by two more rather indistinct chevrons. Legs and palp yellowish brown with a few darker patches. Chelicerae reddish brown.

**Eyes** Ratio of AME.ALE.PME.PLE = 6.10.10.9. AME separated from each other and from the ALE by 10/6 of the diameter of an AME. Lateral eyes separated by 3/6 of the diameter of an AME. PME separated from each other by 11/6 and from the PLE by 15/6 of the diameter of an AME. MOQ wider behind than in front and longer than wide in the front in the ratio of 29.22. Width of the clypeus equal to 2.5 times the diameter of an AME.

**Chelicerae** Retromargin with two small teeth, three stronger teeth on promargin. A prominent ridge extends back from the proximal tooth on the promargin to the base of the chelicera. There is a thick scopula behind promargin.

**Maxillae** Longer than wide in ratio of 5.3, slightly convergent.

**Labium** As long as wide. Lateral margins evenly curved so that width at half-way is equal to 5/3 of the proximal and distal widths. Anterior margin straight with a row of long black hairs.

**Sternum** Scutiform, longer than wide in the ratio of 10.7. Terminated sharply posteriorly between coxae 4.

**Abdomen** Closely clothed with fine hairs, longer on the outer anterior dorsal surface. Cribellum small, division indistinct. Epigynum and internal genitalia as in Figs. 256, 266.

|       | Carapace | length 5.7 | width 3.6 |            |
|-------|----------|------------|-----------|------------|
|       | Abdomen  | length 7.0 | width 5.0 |            |
| Leg   | Femur    | Patella    | Tibia     | Metatarsus |
| 1     | 4.1      | 1.9        | 3.9       | 1.9        |
| 2     | 3.6      | 1.7        | 3.2       | 1.5        |
| 3     | 3.3      | 1.5        | 2.7       | 1.3        |
| 4     | 3.6      | 1.7        | 3.3       | 1.5        |
| Palp  | 1.7      | 0.8        | 1.1       | 1.2        |
| Total |          |            |           | 4.8        |

**Colour** Head region of the carapace reddish brown becoming darker anteriorly and the thoracic region pale orange. Chelicerae dark reddish brown with the bosses paler. Sternum yellowish becoming brown and darkening at the margins. Abdomen brownish grey with an obscure pattern. Anteriorly there is a median dark band

which terminates at the first pair of muscle spots and then a series of obscure pale chevrons. The ventral surface is pale and is bordered laterally by a paler band on each side.

**Eyes** The group occupies 9/14 of the width of the head. From in front the anterior row is straight and from above the posterior row is procurved. The ratio of AME. ALE.PME.PLE = 6.9.8.9. AME separated from each other and from the ALE by a distance equal to 9/6 of the diameter of an AME. Laterals separated by half the diameter of an AME. PME separated from each other by 10/6 and from the PLE by 15/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 26.21 and wider behind than long in the ratio of 26.25. Height of the clypeus equal to twice the diameter of an AME.

**Chelicerae** Viewed laterally the length is 2.0mm and the width 1.6mm.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia and tarsus with numerous spines and bristles. Trichobothria. Tibia, pro-row 1.1.1.1.1 extending to about 3/4 length and a retro-row 1.1.1.1.1 reaching not quite as far. Claw with from 10 to 11 teeth.

**Legs** Femoral spines rather bristle-like and spines on the anterior legs short. First leg. Femur, prolateral spine present, d.1.1.1. p.1.1. r.0.1. Tibia, v.0.0.2. p.r.0. Metatarsus, v.2.2 and a subwhorl of 3, p.r.0. Second leg. Femur, d.1.1.1. p.r.0.1. Tibia, v.0.1.2. p.r.0. Metatarsus, v.2.2 and a subwhorl of 5, p.r.0. Trichobothria. Tibia,

pro-row, 5 situated basally, retro-row, 6 extending beyond the midpoint. Metatarsus, 4 on distal half. Tarsus, 8. On the anterior legs the superior tarsal claws have 12 to 14 and the posterior pairs 10 to 12 teeth. Two teeth on the inferior claws.

**Abdomen** The epigynum and internal genitalia are as shown in Figs. 270, 271. The cribellum has a sclerotized posterior margin and the two spinning fields are well separated.

## **MALE**

## **Measurements**

|       | Carapace | length 5.7 | width 4.0 |            |
|-------|----------|------------|-----------|------------|
|       | Abdomen  | length 5.5 | width 4.0 |            |
| Leg   | Femur    | Patella    | Tibia     | Metatarsus |
| 1     | 5.6      | 2.2        | 6.4       | 6.8        |
| 2     | 4.7      | 1.9        | 4.5       | 4.8        |
| 3     | 3.9      | 1.8        | 3.4       | 3.7        |
| 4     | 4.3      | 1.7        | 3.8       | 4.3        |
| Palp  | 2.2      | 0.9        | 0.9       | 1.7        |
| Total |          |            |           | 5.7        |

In most respects the male resembles the female.

**Eyes** The group occupies slightly less than 2/3 of the width of the head. From in front the anterior row is straight by the upper margins of the eyes and from above the posterior row is procurved. Ratio of AME. ALE.PME.PLE = 7.9.8.9. AME separated from each other by a distance equal to 8/7 and from the ALE by 9/7 of the diameter of an AME. Lateral eyes separated by 2/7 of the diameter of an AME. PME separated from each other by 11/7 and from the PLE by 15/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 27.22 and wider behind than long in the ratio of 27.26. Height of the clypeus 12/7 of the diameter of an AME.

**Palp** The tibial processes and the distal portion of the bulb are shown in Figs. 272, 273.

**Types** Holotype female and allotype male. Second Beach, St Clair, Dunedin, under stones above high tide mark, 9.vii.1966, R. R. Forster (Otago Museum).

**Records** Bull Creek, Otago, under stones above high tide mark, 14.v.1967, C.L.W., R. W. Hutton. Same locality as types, with cocoons and young, 4.i.1966, R.R.F.

| Total |          |                   |            | 19.11  |

**Colour** Carapace orange brown darkening to reddish brown anteriorly. Abdomen dark with white mottling and a pattern of five pairs of dark patches on the posterior two-thirds of the dorsal surface. There are two broad dark bands running down the ventral surface. Legs uniform yellow brown.

**Eyes** Relatively small. The eyegroup occupies 5/8 of the width of the head. From above the anterior row is straight and the posterior row is slightly procurved. Ratio of AME.ALE.PME.PLE = 5.5.5.6. AME separated from each other by 6/5 and from the ALE by 8/5

of the diameter of an AME. Laterals subcontiguous. PME separated from each other by 10/5 and from the PLE by 12/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 20.16 and wider behind than long in the ratio of 20.19.

**Chelicerae** Two teeth on retromargin and three on promargin.

**Abdomen** The epigynum is shown in Fig. 274 and the internal genitalia in Fig. 275.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1.0. p.0.1. r.0. Tibia, v.0.0.2. p.r.0. Metatarsus, v.2.2 (staggered) and a subwhorl of 3. Second leg. Femur, d.1.1.1. p.r.0.1. Tibia, v.0.2.2. p.r.0. Metatarsus, v.2.2 and a subwhorl of 5, p.r.0.

**Types** Holotype female, paratype female. Whero Is., Foveaux Strait, B. J. Marples (Otago Museum).

**Types** Holotype female and paratype females. Solander Island, Foveaux Strait, 20.v.1956, R. K. Dell (Dominion Museum).

#### **Neoramia** n.gen.

Usually large (body length 5-14mm) cribellate spiders. Head region broad and obtuse, heavily pigmented with dark brown anteriorly. Abdomen often with a St. Andrews cross on the dorsal surface. Eight eyes in two

rows, occupying about two-thirds of the width of the head. Anterior row usually straight and the posterior row gently procurved. AME only slightly smaller than remaining eyes which are subequal. Labium longer than wide and notched at the base. Chelicerae stout, with lateral boss and two teeth on the retromargin and three on the promargin. Tibia of the male palp with two or three strong processes on the distal retrolateral surface and a distal plate. Embolus spiniform. Conductor as a stout flattened articulated plate. Median apophysis well developed, weakly sclerotized and hooked apically. Internal genitalia large and receptaculate. External ducts short.

Trochantera not notched. Legs well clothed with long hairs. Hairs not plumose. The prolateral spine on the first pair of legs is present. Full complement of femoral spines often present but reductions occur especially on the first and fourth pairs (*N. koha* n.sp. has an additional spine in the anterior dorsolateral row). All tibiae without dorsal spines. Tibia of the first pair with paired ventral spines, one pair distally situated. Metatarsus of the first pair with a distal whorl of five spines, in some species reduced to three. Tarsal organ distal to trichobothria on legs. Legs without combs and scopulae. Palpal tarsus without trichobothria.

Type species *Amaurobius charybdis* Hogg 1910.

These common spiders occupy most habitats from forest to the high alpine screes as well as scrubland. They are not however found in grassland where there are no rocks or woody plants to provide a retreat. In the South Island they are often found in gardens and could well be transported about. The snare is usually a formless sheet built out from a retreat and seems to lack the laddered structure seen in many dictynoids. The eggsac is basically spherical but when constructed on a substrate it is lenticular, covered with a loose cover of silk.

**Colour** Thoracic region of the carapace orange yellow with the head region reddish orange becoming darker anteriorly. Chelicerae dark reddish brown with the boss paler. Legs yellow brown with some darker banding

specially on the posterior pairs. Sternum yellow brown becoming darker at margins. Maxillae and labium reddish brown with white distal margins. Abdomen rather dark greyish brown. On the basal dorsal surface and within a pale area is a dark median band followed by a pale chevron which forms the typical St. Andrew's cross pattern. The ventral surface is rather pale but darkens slightly posteriorly and is bordered on each side with a row of paler spots.

**Carapace** The width of the head is 0.71 of the widest part of the carapace.

**Eyes** The group occupies 2/3 the width of the head. From in front the anterior row is straight and from above the posterior row is procurved. Ratio of AME. ALE.PME.PLE = 7.8.8.8. AME separated from each other by a distance equal 8/7 and from the ALE by 11/7 of the diameter of an AME. Lateral eyes separated by 2/7 of the diameter of an AME. PME separated from each other by a distance equal to 10/7 and from the PLE by 17/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 26.22 and longer than wide behind in the ratio of 30.26. Height of the clypeus equal to 11/7 of the diameter of an AME.

**Sternum** Longer than wide in the ratio of 40.28.

**Maxillae** Inclined slightly over labium. Longer than its greatest width in the ratio of 26.14.

**Labium** Longer than wide in the ratio of 15.11 and shorter than a maxillary lobe in the ratio of 15.26.

**Chelicerae** Viewed laterally longer than wide in the ratio of 43.25. Two teeth on retromargin. Three on promargin.

Figs. 301-304 *Neoramia setosa* (Bryant). Fig. 301 Epigynum. Fig. 302 Internal genitalia. Fig. 303 Tibial processes of male palp. Fig. 304 Distal portion of male bulb.

**Colour** Similar to the female.

**Eyes** The group occupies slightly more than 2/3 of the width of the head. From in front the anterior row is straight and from above the posterior row is procurved. The ratio of AME.ALE.PME.PLE = 6.8.7.7. AME separated from each other and from the ALE by a distance equal the diameter of an AME. Lateral eyes separated by 2/6 of the diameter of an AME. PME separated from each other by 7/6 and from the PLE by 11/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 21.18 and longer than wide behind in the ratio of 23.21. Height of the clypeus equal to 8/6 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 42.30.

**Palp** The distal portion of the bulb and the tibial processes are shown in Figs. 299, 300.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.1.1.1. p.1.1. r.1.0. Tibia, v.1.2.2. p.1.0. r.0. Metatarsus, v.2.2, no lateral spines, distal subwhorl of 5. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.1.1. r.0.1. Metatarsus, v.2.2. p.1 median. r.1 median, distal subwhorl of 5. The calamistrum occupies 27/88 of the length of the segment.

**Types** Holotype female. Canterbury. Upper Hororata River, 21.i.1922, G. Archey (Canterbury Museum). Allotype male. Canterbury. Hood's Bush, Malvern Hills, 3.v.1953, R. R. Forster (Canterbury Museum).

| 1    | 4.1   | 1.9     | 3.7   | 3.9        | 1.8    | 15.4  |
| 2    | 3.8   | 1.8     | 3.4   | 3.4        | 1.5    | 13.9  |
| 3    | 3.6   | 1.6     | 2.6   | 2.9        | 1.2    | 11.9  |
| 4    | 4.0   | 1.7     | 3.45  | 3.5        | 1.4    | 14.05 |
| Palp | 1.6   | 0.7     | 1.1   |            | 1.6    | 5.0   |

**Colour** Thoracic region of the carapace pale yellow gradually shaded to brown on the mid-dorsal surface of the head and becoming much darker anteriorly and laterally. Dark veinlike markings on the head. Chelicerae dark reddish brown with lateral condyles paler. Legs pale yellow shaded with pale orange brown and with dark bandings on all legs. Sternum pale yellow becoming brown at the margins. Maxillae and labium dark orange brown and white at distal margins. Abdomen very dark except for the pattern area in which the anterior median black band is extremely faint. The ventral surface dark, clearly separated from the lateral surfaces by a pale band on each side. Two longitudinal rows of five spots on the mid ventral surface.

**Eyes** The group occupies 2/3 the width of the head. From in front the anterior row slightly procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 6.9.8.9. AME separated from each other by a distance equal to 7/6 and from the ALE by 11/6 of the diameter of an AME. Lateral eyes separated by 3/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 26.19 and longer than wide behind in the ratio of 30.26. Height of clypeus equal to 12/6 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 37.25. The two teeth on retromargin rather closely spaced.

**Legs** Spines. First leg. Femur, typical prolateral spine present. d.1.1.1. p.r.0.1. Tibia, v.1.2.2. p.1.1. r.0.1. Metatarsus, v.2.2. p.1 median. r.1 median, distal subwhorl of 5. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.r.1.1. Metatarsus, same as the first leg. The calamistrum occupies 29/94 of the segment. Tarsus of the first pair of legs with 7 trichobothria. Superior claws with 12 teeth, inferior claw with two teeth.

*Palp* Spines. Femur, d.1.1.1. Patella, 1.1. Tibia, d.1.1. p.1 basal 1.1 distal. r.2 distal. Trichobothria. Tibia, pro-row of 4, retro-row longer of 5.

*Abdomen* The epigynum and internal genitalia are shown in Figs. 301, 302.

| Palp | 1.15  | 0.55    | 0.8   |            | 1.3    | 3.8   |

*Colour* Thoracic region of the carapace pale orange yellow and the cephalic region pale brownish orange becoming darker at the anterior and lateral margins. Veinlike markings present. Chelicerae dark orange brown with the lateral condyles only slightly paler. Legs brownish yellow with dark bandings. Sternum pale yellow becoming brown at the anterior and lateral margins. Maxillae and labium dark orange brown with white distal margins. Abdomen pale greyish brown with scattered brown flecks which become more numerous on the posterior and posterolateral slopes. On the anterior slope there is a median grey band which is followed by the "cross" pattern. On the live spider short white hairs make the cross more conspicuous than in preserved specimens. There is a rather short dark band on each side of the "cross". The ventral surface is pale without any pattern.

*Eyes* The group occupies 7/10 of the width of the head. From in front the anterior row is straight and from above the posterior row procurved. The ratio of AME.ALE.PME.PLE = 6.8.8.8. AME separated from each other and from the ALE by a distance equal to 7/6 of the diameter of an AME. Lateral eyes separated by 1/6

of the diameter of an AME. PME separated from each other by 9/6 and from the PLE by 12/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 25.19 and wider behind than long in the ratio of 25.24. Height of the clypeus equal to 10/6 of the diameter of an AME.

*Chelicerae* Viewed laterally longer than wide in the ratio of 52.33.

*Legs* Spines. First leg. Femur, typical prolateral spine present. d.1.1.1. p.0.1. r.1.1. Tibia, v.0.2.2. p.1.1. r.0.1. Metatarsus, v.2.2 and a distal subwhorl of 5, p.1. r.1. Second leg. Femur, d.1.1.1. p.0.1. Tibia, v.0.2.2. p.1.1. Metatarsus, same as the first leg. The calamistrum occupies 0.46 of the length of the metatarsus.

*Palp* Spines. Femur, d.1.1.1. Patella, 1.1. Tibia, d.1.1. p.1.2. r.v.1 distal. Trichobothria. Tibia, double row of 5.

*Abdomen* The epigynum and internal genitalia are shown in Figs. 306, 307.

Figs. 314-317 *Neoramia childi* n.sp. Fig. 314 Epigynum. Fig. 315 Internal genitalia. Fig. 316 Tibial processes of male palp. Fig. 317 Distal portion of male bulb.

**Colour** Thoracic region of the carapace pale yellowish orange with the head shading to dark reddish brown anteriorly. Chelicerae very dark reddish brown with the lateral condyles paler. Legs yellowish brown without banding. Sternum yellowish brown becoming brown at the margins. Maxillae and labium orange brown with white distal margins. Abdomen dark yellowish brown without any definite pattern but slightly paler in the cross area where the four muscle spots are rather conspicuously pale. The ventral surface is of the same general colour and is separated from the lateral surfaces by a thin white band on each side. In the area between the epigastric furrow and the spinnerets is a sequence of six pairs of small white spots.

**Eyes** The group occupies 5/8 of the width of the head. From in front anterior row straight and from above posterior row procurved. Ratio of AME.ALE.PME.PLE = 6.9.7.7. AME separated from each other by a distance equal to 8/6 and from the ALE by 14/6 of the diameter of an AME. Lateral eyes separated by 4/6 of the diameter of an AME. PME separated from each other by 13/6 and from the PLE by 21/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 27.20 and longer than wide behind in the ratio of 28.27. Height of clypeus equal to 14/6 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 78.52.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1. p.0.1. r.1.1. Tibia, v.0.2.2. p.r.0. Metatarsus, v.2.2 and a distal subwhorl of 3, p.r.0. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.r.1. Metatarsus, v.2.2 and a distal subwhorl of 5, p.r.1 median. The calamistrum occupies 0.35 of the length of the segment. Trichobothria. First leg. Tibia, pro-row of 5 and a retro-row of 6. Metatarsus and tarsus, 7.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.1.1. p.1.2. r.2 distal. Trichobothria. Tibia, pro-row 1.1.1.1.1, retro-row 1.2.1.1.1.1. Claw with ten teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 314, 315.

Fig. 318 *Neoramia mamoea* n.sp. female.

In general appearance resembles the female.

**Eyes** The group occupies 13/20 of the width of the head. From in front the anterior row is very slightly procurved. Ratio of AME.ALE.PME.PLE = 7.9.8.9. AME separated from each other by a distance equal to 10/7 and from the ALE by 16/7 of the diameter of an AME. Laterals separated by 4/7 of the diameter of an AME. PME separated from each other by 14/7 and from the PLE by 26/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 10.8 and longer than wide behind in the ratio of 11.10. Height of the clypeus equal to 15/7 of the diameter of an AME.

**Palp** Trichobothria. Tibia, dorsal surface with a row of 5 and retrolateral surface with one near the base of the median finger of the process and a row of 5. The tibial processes and the distal portion of the bulb are shown in Figs. 316, 317.

**Legs** The calamistrum is not as regular as that of the female and appears to become in places a double row, especially the distal part. The tarsus of the first leg has a row of eight trichobothria.

**Types** Holotype female. Otago. Rock and Pillar Range, 21.ii.1954, B. J. Marples. Allotype male. Otago. Pitfall trap N.5, Rock and Pillar Rge, one mile south of Summit Rock ski hut, 4,500 ft, cushion veg., 30.iii.1969, J. Child (Otago Museum).

**Records** Same data as the holotype, one female. Rock and Pillar Rge, 4,500 ft, under rock, 16.xi.1968, J. Child, same locality, 29.iv.1969, J. Child. Mt Kyeburn, ca. 5,200 ft, 12.iv.1970, D. R. Forster. The following is a record of the specimens examined from pitfall traps set by Dr J. Child on the Rock and Pillar Range during 1968-1969. N.1. Lug Crk, matagouri scrub, 800 ft, 18.xii.1968, 3 males. N.3. 1 mile south of Summit Rock, ski hut, 4,500 ft, edge of bog, 1.xii.1968, 1 female; 18.i.1969, 1 immature; 28.ii.1969, 2 males and 1 immature; 30.iii.1969, 1 male; 29.iv.1969, 1 female and 3 immature. N.4. 1 mile south of Summit Rock, ski hut, 4,500 ft, herbfield, 17.xi.1968, 4 immature; 18.xii.1968, 1 immature; 18.i.1969, 2 immature; 28.ii.1969, 1 male and 3 immature; 30.iii.1969, 1 female and 3 immature; 29.iv.1969, 2 females. N.5. 1 mile south of Summit Rock, ski hut, 4,500 ft, cushion vegetation, 28.ix.1968, 10 males and 6 immature; 1.xii.1968, 1 female and 1 immature; 18.i.1969, 1 male and 4 immature; 30.iii.1969, 2 males, 1 female and 4 immature; 29.iv.1969, 3 females. N.6. Half mile north of Summit Rock. Geogr. Stn, 4,500 ft, cushion vegetation, 18.xii.1968, 1 female;

18.i.1969, 3 males and 3 immature; 28.ii.1969, 7 males, 1 female and 1 immature; 30.iii.1969, 4 males; 29.iv.1969, 2 females and 1 immature.

## FEMALE

### Measurements

|      | Carapace | Abdomen | length 6.6 | length 6.6 | width 4.4 | width 4.1 |  |
|------|----------|---------|------------|------------|-----------|-----------|--|
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus    | Total     |  |
| 1    | 5.1      | 2.2     | 4.85       | 4.75       | 2.3       | 19.20     |  |
| 2    | 4.9      | 2.0     | 4.25       | 4.2        | 1.9       | 17.25     |  |
| 3    | 4.35     | 2.0     | 3.35       | 3.6        | 1.6       | 14.90     |  |
| 4    | 4.65     | 2.0     | 3.9        | 4.0        | 1.7       | 16.25     |  |
| Palp | 2.2      | 1.0     | 1.3        |            | 1.9       | 6.40      |  |

**Colour** Carapace pale yellow with a faint orange tinge becoming brownish orange anteriorly. Chelicerae dark reddish brown with the bosses paler. Legs pale yellow tinged with orange and with dark bands. On the anterior dorsal surface there is a pale area which terminates just behind the muscle spots with a pale chevron. The rest of the dorsal and lateral surfaces are dark brown (Fig. 318). The ventral surface of the abdomen pale brown with the lateral surfaces clearly defined.

**Eyes** The group occupies about 5/8 of the width of the head. From in front the anterior row slightly procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 5.6.5.6. AME separated from each other by a distance equal to 6/5 and from the ALE by 10/5 of the diameter of an AME. Laterals separated by 2/5 of the diameter of an AME. PME separated from each other by 9/5 and from the PLE by 15/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 19.16 and longer than wide behind in the ratio of 21.19. The height of the clypeus is equal to twice the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 30.24.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1.1. Tibia, p.1.3. d.1 basal, r.1.1. Tarsus with numerous long spines. Trichobothria. Tibia, two rows of five but the pro-row is shorter than the retro-row.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.1.1.1. r.0.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.r.1 median. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.r.0.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.0. r.1 median. Trichobothria. First leg. Tibia, a pro-row of 5 on the basal quarter and a retro-row of 6 extending to the mid point.

Metatarsus and tarsus, 8. Fourth leg. Tibia, a pro-row of 5 on the basal quarter and a retro-row of 8 extending to the mid point. Metatarsus, 6. Tarsus, 7. Superior claws of the first leg with 11 teeth and fourth leg with 10.

**Abdomen** The epigynum and internal genitalia are as shown in Figs. 319, 320.

## MALE

### Measurements

|      | Carapace | Abdomen | length 6.5 | length 6.2 | width 4.3 | width 4.3 |  |
|------|----------|---------|------------|------------|-----------|-----------|--|
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus    | Total     |  |
| 1    | 6.1      | 2.4     | 6.7        | 6.6        | 2.5       | 24.3      |  |
| 2    | 5.7      | 2.3     | 5.6        | 5.5        | 2.2       | 21.3      |  |
| 3    | 5.0      | 2.0     | 4.2        | 4.5        | 1.8       | 17.5      |  |
| 4    | 5.4      | 2.1     | 4.7        | 5.0        | 2.0       | 19.2      |  |
| Palp | 2.3      | 0.9     | 1.0        |            | 2.1       | 6.3       |  |

**Eyes** Viewed from in front the anterior row is very slightly procurved. Ratio of AME.ALE.PME.PLE = 9.12.10.12. AME separated from each other by a distance equal to 8/9 and from the ALE by 13/9 of the diameter of an AME. Laterals separated by 2/9 of the diameter of an AME. PME separated from each other by 14/9 and from the PLE by 21/9 of the diameter of an AME. MOQ wider behind than in front in the ratio of 34.26 and longer than wide behind in the ratio of 36.34. Height of clypeus equal to 15/9 of the diameter of an AME.

**Palp** The tibial processes and the distal portion of the bulb are shown in Figs. 321, 322.

**Type** Holotype female. Fiordland. Mt Irene, 4,700 ft, 27-29.i.1953, B. Wisely. Allotype male. Fiordland. Te Au, near South Arm of Lake Te Anau, 12-24.i.1953, R. R. Forster (Canterbury Museum).

**Records** A male and a female, same data as allotype.

| Palp    | 2.2        | 1.0        | 1.3 1.9 6.4                   |

**Colour** Thoracic region of the carapace cream tinged with orange and the head gradually darkening through brownish red to almost black anteriorly. Dark vein-like markings are present between the fovea and eyes. Chelicerae very dark with lateral condyles brownish red. Legs cream, tinged with orange and with dark bands. Sternum brownish yellow becoming darker at the margins except the posterior projection which is paler, this pale area tapers forward a short distance. The maxillae and labium are dark reddish brown with white tips. The anterior surface of the abdomen is covered with a pale area which tapers posteriorly to disappear just beyond the midpoint. Lateral and posterior surfaces dark. Ventral surface pale, separated from the lateral surfaces on each side by a band of confluent white spots.

**Eyes** The group occupies 2/3 of the width of the head. From in front the anterior row slightly procurved and the posterior row procurved. From above the anterior row straight and the posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 10.12.9.11. AME separated from each other by a distance equal to their diameter and from the ALE by 17/10 of the diameter of an AME. Laterals separated by 4/10 of the diameter of an AME. PME separated from each other by 14/10 and from the PLE by 26/10 of the diameter of an AME. MOQ wider behind than in front in the ratio of 32.30 and longer than wide behind in the ratio of 39.32. Height of clypeus equal to 17/10 of the diameter of an AME.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Patella, 1.1. Tibia, d.1.1. p.1.2. r.0.1. Tarsus with numerous spines. Trichobothria. Tibia, two rows of 5. Tarsus, 0. Claw with seven teeth.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.1.1. r.0.1. Metatarsus, v.2.2 and subwhorl of 5, p.r.1 median. The spination of the other legs is typical. Trichobothria. First leg. Tibia, pro-row 1.1.2.1.1 on basal quarter, retro-row 1.1.1.1.1.1 on basal half. Metatarsus, 6. Tarsus, 7. The metatarsus of leg 3 and tarsus of leg 4, with 8. Superior claws with seven teeth, inferior claws one.

325

**Abdomen** The epigynum and internal genitalia are shown in Figs. 323-324.

**Types** L. Koch described the male from Auckland (not seen). Plesiotype female. Ngapuhi Rd, Remuera, Auckland, Winter 1970, M. P. Buchler (Otago Museum).

## Measurements

|         | Carapace   | length 4.3 | width 2.9                     |
|---------|------------|------------|-------------------------------|
| Abdomen | length 4.3 | width 2.8  |                               |
| Leg     | Femur      | Patella    | Tibia Metatarsus Tarsus Total |
| 1       | 2.8        | 1.2        | 2.6 2.5 1.25 10.35            |
| 2       | 2.7        | 1.3        | 2.2 2.2 1.2 9.5               |
| 3       | 2.4        | 1.25       | 1.8 1.85 0.9 8.2              |
| 4       | 2.8        | 1.3        | 2.3 2.3 0.8 9.5               |
| Palp    | 1.25       | 0.55       | 0.75 1.2 3.75                 |

**Colour** Carapace pale creamy orange, shading to dark orange brown anteriorly. Two dark veinlike lines diverge from a common origin, one on each side, towards the lateral eyes where they merge into the darker anterior region. Chelicerae very dark orange brown with the lateral condyles conspicuously paler. Legs with olive banding which on the femora are confined to the ventral surfaces. Sternum pale shading to brown at margins. Maxillae and labium orange brown with white distal margins. Abdomen with typical pattern well defined. The dark flecks are rather spaced on the anterior and antero-lateral surfaces giving these regions a somewhat paler appearance than that of the posterior surfaces. The ventral surface dark with four longitudinal pale bands.

**Eyes** The group occupies about 5/8 of the width of the head. From in front the anterior row is slightly procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 4.8.6.7. AME separated from each other by a distance equal to 8/4 and from the ALE by 12/4 of the diameter of an AME. Laterals eyes separated by 3/4 of the diameter of an AME. PME separated from each other by 11/4 and from the PLE by 15/4 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.16 and longer than wide behind in the ratio of 24.23. Height of clypeus equal to 12/4 of the diameter of an AME.

**Chelicerae** Viewed laterally, longer than wide in the ratio of 50-38.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.1.1.1. p.0.1. r.1.1. Tibia, v.2.2.2. p.1.1. r.0.1. Metatarsus, v.2.2, p.r.0.1. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.2.2.2. p.r.1.1. Metatarsus, v.2.2. p.1.1. r.0.1 and distal subwhorl of 5. Superior claws with 12 teeth and inferior claw with three teeth. Trichobothria.

326

First leg. Tibia, a pro-row of 5 on the basal quarter and a retro-row of 6 extending to the midpoint. Metatarsus and tarsus, 8. Fourth leg. Tibia, a pro-row of 5 on the basal quarter and a retro-row of 8 extending to the midpoint. Metatarsus, 6. Tarsus, 7.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.1.1. p.1.1.1. r.1 distal. Tarsus with numerous spines. Trichobothria. Tibia, a pro-row of 4 and a retro-row of 5. Claw small with about ten teeth.

**Abdomen** The epigynum and internal genitalia are as in Figs. 327-328.

**Colour** (Fig. 331). Carapace pale orange with the whole surface stippled with black. Vein-like markings are present on the cephalic region. Chelicerae orange brown with the lateral condyles slightly paler. Legs yellowish brown with dark bandings. Sternum pale yellow mesially but stippled with black towards posterior and lateral margins. Maxillae and labium pale orange brown with the distal margins white. Short white hairs are evident on most of the surface of the live animal but the longer hairs are pale brown and are not conspicuous. The ventral surface is pale.

**Eyes** The group occupies slightly more than 2/3 of the width of the head. From in front the anterior row is procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 3.5.4.5. AME separated from each other and from the ALE by a distance equal to 4/3 of the diameter of an AME. Lateral eyes separated by 1/3 of the diameter of an AME. PME separated from each other by 5/3 and from the PLE by 7/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 13.10 and longer than wide behind in the ratio of 14.13. Height of clypeus equal to 5/3 of the diameter of an AME.

**Chelicerae** Viewed laterally, longer than wide in the ratio of 27.19.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.l.l.l. p.r.o.l. Tibia, v.l.l.2. p.l. r.o. v.2.2 and distal subwhorl of 3, p.r.o. Second leg. Femur, d.l.l.l. p.r.o.l. Tibia, v.o.2.2. p.l.l. r.o. Metatarsus, v.2.2 and a distal subwhorl of 5, p.r.l. The calamistrum occupies 0.42 of the length of the segment. Trichobothria. Tarsus of the first leg with a row of 5, the distal one situated at a point which is 0.75 of the length of the segment measured from the base. Superior claws with 13-16 teeth, the pectination reaching to almost the tip. Inferior claw with three teeth.

**Palp** Spines. Femur, d.l.l.l. Patella, d.l.l. Tibia, d.l.l. p.l.2. r.o.2 (bristles). Tarsus with numerous spines.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 332, 333.

**Type** Holotype female. Canterbury. Porter's Pass, 29.ix.1966, R. R. Forster (Otago Museum).

333

Fig. 332-333 *Neoramia raua* n.sp. Fig. 332 Epigynum. Fig. 333 Internal genitalia.

**Colour** The thoracic region of the carapace pale cream and the head region orange brown becoming darker anteriorly with dark vein-like markings. Chelicerae very dark orange brown with the lateral condyles much paler. Legs yellowish brown with darker bandings. Sternum pale yellow with brown margins. Maxillae and labium orange brown with white distal margins. The median dark band on the abdomen anterior to the St. Andrew's cross pattern is very faint and the dark flecks on the anterior and antero-lateral surfaces quite widely spaced giving those regions a pale appearance and making the dark bands on each side of the pattern very distinct. The ventral surface is pale.

**Eyes** The group occupies about 2/3 of the width of the head. Viewed from in front the anterior row is straight and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 5.7.7.7. AME separated from each other by a distance equal to 6/5 and from the ALE by 7/5 of the diameter of an AME. Lateral eyes separated by 3/5 of the diameter of an AME. PME separated from each other by 8/5 and from the PLE by 12/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 22.16 and longer than wide behind in ratio of 24.22. Height of clypeus equal to 8/5 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 26.17. The two teeth of the retromargin of the cheliceral groove rather widely spaced.

**Palp** Claw with 11 teeth.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.l.l.l. p.r.o.l. Tibia, v.l.2.2. p.l.l. r.o.l. Metatarsus, v.2.2. p.l median. r.l median and a distal subwhorl of 5. Second leg. Femur, d.l.l.l. p.r.l.l. Tibia, v.2.2.2. p.r.l.l. Metatarsus, v.2.2. p.l.l. r.o.l and a distal subwhorl of 5. The calamistrum occupies 30/84 of the length of the metatarsus. Trichobothria. First leg. Tibia, two rows situated basally, the pro-row with four and the retro-row with five. Metatarsus, a single row of six. Tarsus, a single row of seven. The superior claws of a first leg with 13 or 14 teeth. Inferior claw with two teeth. Superior claws of fourth leg with seven to 9 teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 334, 335.

| 4    | 2.4   | 1.0     | 2.0   | 1.9        | 0.9    | 8.2   |
| Palp | 1.0   | 0.5     | 0.6   |            | 1.0    | 3.1   |

**Colour** Thoracic region of the carapace pale yellowish orange and cephalic region orange brown. Chelicerae orange brown. Legs pale yellowish orange with dark bandings. Sternum pale yellow shading to yellowish brown at the margins. Maxillae and labium orange brown with white distal margins. Abdomen with the typical pattern. The dark bands extending posteriorly from each side of the "cross" are discernible as well as several rather indistinct chevrons. The long hairs are golden brown and confined to the fore part but the whole surface is well covered with shorter hairs of the same colour. The ventral surface is pale and darkens towards the lateral margins on each side but the pale bordering bands are not very conspicuous.

**Eyes** The group occupies about 2/3 of the width of the head. From in front the anterior row is slightly procurved and from above the posterior row procurved. Ratio of AME.ALE.PME.PLE = 10.15.14.15. AME separated from each other and from the ALE by a distance equal to 14/10 of the diameter of an AME. Lateral eyes separated by a distance equal to the radius of an AME. PME separated from each other by 18/10 and from the PLE by 25/10 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.17 and wider behind than long in the ratio of 23.22. Height of clypeus equal to 15/10 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 31.24.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.l.l.l. p.r.o.l. Tibia, v.o.l.l. p.l.l. r.o.l. Meta-

Figs. 343-344 *Neoramia hokina* n.sp. Fig. 343 Epigynum. Fig. 344 Internal genitalia.

tarsus, v.2.2 and a distal subwhorl of 5, p.l median, r.l median. Second leg. Femur, d.l.l.l. p.r.l.l. Tibia, v.0.2.2. p.r.l.l. Metatarsus, v. same as the first leg. p.l median, r.0. The calamistrum occupies 7/24 of the length of the segment. Tarsus of the first leg has a row of six trichobothria and the tarsus of a fourth leg has a row of five. There are 13 teeth on the superior claws of the first leg and nine on the fourth leg.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 340-342.

**Type** Holotype female. Westland. Fox Glacier, l.ix.1951, M. Warren (Otago Museum). Paratype female. Same data as holotype.

| 3    | 4.3      | 2.0     | 3.4        | 3.6        | 1.4       | 14.7  |
| 4    | 4.7      | 2.2     | 4.0        | 4.1        | 1.7       | 16.7  |
| Palp | 2.3      | 1.0     | 1.4        |            | 2.1       | 6.8   |

**Colour** Thoracic region of the carapace yellowish orange. Head region reddish becoming darker anteriorly, with obscure vein-like markings. Chelicerae very dark reddish brown and although the bosses are paler they are darker than is usual. Legs yellowish orange with dark bands. Abdomen typically patterned, with distinct red muscle spots. Ventral surface without pattern and

clearly separated from the lateral surfaces by a row of pale spots on each side.

**Carapace** Viewed laterally it is moderately elevated and reaches its highest point about midway between the medium fovea and the PME. The width of the head is 10/13 of the greatest width of the carapace.

**Eyes** The group occupies slightly less than 2/3 of the width of the head. From in front the anterior row is very slightly procurved. Ratio of AME.ALE.PME.PLE = 7.9.8.8. AME separated from each other by a distance equal to 8/7 and from the ALE by 15/7 of the diameter of an AME. Laterals separated from each other by 4/7 of the diameter of an AME. PME separated from each other by 16/7 and from the PLE by 22/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 32.22 and wider behind than long in the ratio of 32.31. Height of clypeus equal to 15/7 of the diameter of an AME.

**Chelicerae** Viewed laterally, longer than wide in the ratio of 32.22. The two teeth on the retromargin of the groove are almost contiguous and very uneven in size. The tooth which is further from the base of the fang is by far the larger and is almost as large as the biggest tooth on the promargin.

**Palp** Spines. Femur, d.l.l.l. Patella, d.l.l. Tibia, d.l.l. p.l basal l.l distal. r.l distal. Tarsus with numerous spines. Trichobothria. Tibia, pro-row l.l.l.l.l.l, retro-row l.l.l.l.l.l.

**Legs** Spines. First leg. Femur, prolateral spine present, d.l.l.l. p.r.l.l. Tibia, v.2.2.2. p.l.l.l. r.l.l. Metatarsus, v.2.2 and a subwhorl of 5, p.r.l median. Second leg. Femur, d.l.l.l. p.r.l.l. Tibia, v.2.2.2. p.r.l.l. Metatarsus v.2.2 and subwhorl of 5, p.r.l median. Trichobothria. First leg. Tibia, pro-row l.l.l.l. on the basal quarter, retro-row l.l.l.l.l.l extending to the midpoint. Metatarsus, 7. Tarsus, 9. Superior claws of a first leg with 13 teeth. Inferior claw with three teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 348-352.

*Colour* (Fig. 355). Thoracic region of the carapace pale brown and the head region dark reddish brown. Abdomen pale, with black shading which leaves a pale area on the mid-dorsal surface.

*Eyes* From above the anterior row is straight and the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 3.6.5.5. AME separated from each other and from the ALE by a distance equal to the width of an AME. Lateral eyes subcontiguous, PME separated from each other by 4/3 and from the PLE by 6/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 14.9, and wider behind than long in the ratio of 14.13. Width of the clypeus equal to 5/3 of the diameter of an AME.

*Chelicerae* Typical with two teeth on the retromargin and three on the promargin. There is a carina extending down the ventral surface from the proximal promarginal tooth.

*Palp* As in Figs. 358, 359.

#### FEMALE

##### Measurements

|      | Carapace | length  | width | Abdomen    | length | width | Total |
|------|----------|---------|-------|------------|--------|-------|-------|
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus |       |       |
| 1    | 2.21     | 1.02    | 2.38  | 2.04       | 1.02   |       | 8.67  |

**Colour** Thoracic region of the carapace yellowish orange and the head region reddish orange becoming darker anteriorly. Chelicerae dark reddish brown with the lateral condyles slightly paler. Legs yellowish orange with prominent dark bandings. Sternum pale yellow with brown anterior and lateral margins. Maxillae and labium orange brown with white distal margins. Abdomen dark brown with very little pattern apart from the "cross". The ventral surface is separated from the darker lateral surfaces by a pale band on each side.

**Eyes** The group occupies about 2/3 of the width of the head. From in front the upper margins of the eyes of the anterior row are in a straight line and from above the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 5.8.7.8. AME separated from each other by a distance equal to 8/5 and from the ALE by 11/5 of the diameter of an AME. Lateral eyes separated by 2/5 of the diameter of an AME. PME separated from each other by 10/5 and from the PLE by 15/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 24.18 and wider behind than long in the ratio of 24.22. Height of clypeus equal to 14/5 of the diameter of an AME.

**Chelicerae** Viewed laterally longer than wide in the ratio of 50-35.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.l.l.l. p.r.l.l. Tibia, v.2.2.2. p.l.l.r.0.1. Metatarsus, v.2.2.1, p.r.l.2. Second leg. Femur, d.l.l.l. p.r.l.l. Tibia, v.2.2.2. p.r.l.l. Metatarsus, v.2.2.1. p.2.2. r.l.2. The calamistrum occupies 0.35 of the length of the metatarsus.

**Abdomen** The epigynum and the internal genitalia are shown in Figs. 362, 363.

| Palp | 1.30     | 0.65    | 0.75        |            | 1.25   | 3.95  |

**Colour** Thoracic portion of carapace cream with slight brown shading and the head darkens through brown to become almost black anteriorly. The legs are pale without bands. The sternum is brownish yellow, darker at the margins and with some dark shading which includes the posterior projection. The pattern on the dorsal surface of the abdomen is shown on Fig. 369. The ventral surface is brown with a series of five pairs of white spots between the epigastric furrow and the spinnerets.

**Eyes** The group occupies 3/5 of the width of the head. From in front the anterior row is straight by the posterior margins and from above the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 5.9.7.8.

AME separated from each other by a distance equal to 6/5 and from the ALE by 8/5 of the diameter of an AME. Laterals separated by 2/5 of the diameter of an AME. PME separated from each other by 9/5 and from the PLE by 14/5 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.16 and wider behind than long in the ratio of 23.22. Height of clypeus equal to 9/5 of the diameter of an AME.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Patella, 1.1. Tibia, d.1.1. p.1 basal and 1.1 distal. Trichobothria. Tibia, pro-row 1.1.1.1.1, retro-row 1.1.1.1.1. Tarsus, 0. A small tarsal organ is present. Claw with ten teeth.

**Legs** Femoral spines long and slender and tibial and metatarsal spines of the first pair short. Spines. First leg. Femur, prolateral spine present, d.1.1.0. p.1.1. r.0. Tibia, v.0.1.2. p.r.0. Metatarsus, v.2.2.3. p.r.0. Trichobothria. First leg. Tibia, pro-row 2.1.1.1 basal, retro-row 1.1.1.1.1 to the midpoint. Metatarsus, 5. Tarsus, 6. Tarsus of third and fourth legs with 5. Superior claws with from nine to ten teeth and the inferior claw one.

**Abdomen** The spinning fields of the cribellum are oblong with rounded angles. The epigynum and internal genitalia are shown in Figs. 370, 371.

| Palp | 1.3      | 0.6     | 0.9        |            | 1.3       |  | 4.1   |

**Colour** Carapace yellowish orange shading to dark reddish brown anteriorly. Chelicerae dark reddish brown with the lateral condyles paler. Legs yellowish orange without dark banding. Sternum yellowish brown shading to orange brown at anterior and lateral margins. Maxillae and labium orange brown with white distal margins. The dorsal surface of the abdomen is strongly patterned.

**Eyes** The group occupies about  $3/5$  of the width of the head. Viewed from in front the lower margins of the anterior row are in a straight line and from above the posterior row is procurved. Ratio of AME.ALE. PME.PLE = 5.7.6.7. AME separated from each other by a distance equal to  $6/5$  and from the ALE by  $10/5$  of the diameter of an AME. Lateral eyes separated by  $1/5$  of the diameter of an AME. PME separated from each other by  $7/5$  and from the PLE by  $15/5$  of the diameter of an AME. MOQ wider behind than in front in the ratio of 19.16 and longer than wide behind in the ratio of 21.19. Height of the clypeus is equal to  $11/5$  of the diameter of an AME.

**Chelicerae** Viewed laterally, longer than wide in the ratio of 5.4.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.0. p.1 basal, 1.1 distal. r.2 distal. Claw with 11 teeth. Trichobothria. Tibia, pro-row 1.1.1.1, retro-row 1.1.1.1.1, extending further than the prorow.

**Legs** Spines. First leg. Femur, prolateral spine present. d.1.1.1. p.1.1. r.0.1. Tibia, v.2.2.2. p.1. r.0. Metatarsus, v.2.2 and a distal subwhorl of 3, p.r.0. Second leg. Femur, d.p.r.1.1.1. Tibia, v.2.2.2. p.1. r.0. Metatarsus, v.2.1 and a distal subwhorl of 3, p.1. r.0. The calamis-trum occupies 0.30 of the length of the metatarsus.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 374-375.

**Colour** Cephalothorax reddish brown with dark shading anteriorly, so that the area in front and at the sides of the eyes is black. Abdomen greyish brown with two parallel, longitudinal, pale bands down the anterior half of the mid-dorsal surface, followed by three indistinct, pale chevrons. Ventral surface with a longitudinal row of pale spots near each lateral margin. Chelicerae black, legs pale yellow, sternum reddish brown.

**Eyes** The eyegroup occupies  $2/3$  of the width of the head in that region. From above the anterior row is straight and the posterior row is procurved. Ratio of

Figs. 379-382 *Neoramia hoggi* (Forster). Fig. 379 Epigynum. Fig. 380 Internal genitalia. Fig. 381 Tibial processes of male palp. Fig. 382 Distal portion of male bulb.

AME.ALE.PME.PLE = 7.11.10.11. AME separated from each other by 10/7 and from the ALE by 14/7 of the diameter of an AME. Lateral eyes separated by a distance equal to 5/7 of the diameter of an AME. PME separated from each other by 16/7 and from the PLE by 22/7 times the diameter of an AME. MOQ wider behind than in front and longer than wide in the front in the ratio of 19.12.

**Chelicerae** Stout, vertical, promargin with three teeth, retromargin with two teeth.

**Legs** Spination as in *crucifera*. Trichobothria. Leg. 1. Tibia, 2.2.2 proximal. Metatarsus, 3 distal. Tarsus, 6. Leg. 2. Tibia, 2.2.2.2. Metatarsus, 5. Tarsus, 4. Leg. 3. Tibia, 2.2.2.2. Metatarsus and tarsus, 4. Leg. 4. Tibia, 2.2.2.2.2. Metatarsus, 5. Tarsus, 4. Superior claws with ten teeth. Inferior claw with two long curved teeth.

**Palp** Tibia with 8 trichobothria arranged 2.2.2.2. Claw slender and smooth. Epigynum as in Fig. 378. Internal genitalia as in Fig. 380.

#### MALE

##### Measurements

| Leg | Carapace |         | length |            | width  |  | Total |
|-----|----------|---------|--------|------------|--------|--|-------|
|     | Femur    | Patella | Tibia  | Metatarsus | Tarsus |  |       |
| 1   | 3.78     | 1.35    | 3.60   | 3.42       | 1.62   |  | 13.77 |
| 2   | 3.24     | 1.26    | 2.88   | 2.70       | 1.44   |  | 11.52 |
| 3   | 2.70     | 1.17    | 2.16   | 2.45       | 1.26   |  | 9.74  |
| 4   | 3.06     | 1.26    | 2.70   | 2.88       | 1.35   |  | 11.25 |

Similar to female. Bifid process on tibia of palp (Fig. 381), slightly different from *crucifera* (Fig. 386) while the distal plate is indented along the dorsal margin where in *crucifera* it is evenly curved. The embolus, conductor and median apophysis are quite distinct from *crucifera* as shown in Figs. 382, 385.

**Types** Holotype male, allotype female. Campbell Is., x.1961, V. O'Neill (Dominion Museum).

**Records** A very large series of specimens have been collected by various expeditions in recent years from all parts of Campbell Island. The species is closely related to *crucifera* but may be separated by the form of the male palp and the epigynum and internal genitalia of the female. *N. hoggi* and *N. crucifera* appear to be related to the *N. fiordensis* series from the Fiordland and Westland region of the South Island of New Zealand.

| Palp | 1.58     | 0.68    | 0.48   |            | 1.60   |  | 4.34  |

Similar to the female in general characters. The tibial process is bifid and the distal plate has the form shown in Fig. 386. The embolus is relatively short and slightly sinuous and the conductor has the form shown in Fig. 385.

**Types** The types of *Rubrius cruciferus* Hogg are from the Auckland Islands and are housed in the Canterbury Museum.

Figs. 383-386 *Neoramia crucifera* (Hogg). Fig. 383 Epigynum. Fig. 384 Internal genitalia. Fig. 385 Distal portion of male bulb. Fig. 386 Tibial processes of male palp.

*Records* A large number of specimens have been collected from many localities in the Auckland Is. including the smaller islands in the Auckland group, Ewing Is., Ocean Is., French Is., Disappointment Is., Adams Is., and Enderby Is. The species is restricted to the Auckland Islands.

#### Family STIPHIDIIDAE Dalmas 1917

1917 *Stiphidiinae* Dalmas. Ann. Soc. Ent. France. 86: 325.

Dalmas established the sub-family Stiphidiinae for the two genera *Stiphidium* Simon (= *Stiphidium*) and *Stiphidiellum* Dalmas (synonym of *Laestrygones* Urquhart, Desidae) which he placed in the Psecridae. He did not recognise the relationship with *Cambridgea* which he placed in the Agelenidae or *Ischalea* which he listed in the Pisauridae.

Emphasis has been placed on the strongly re-curved eyes characteristic of the type species of *Stiphidium*, but it seems that there are closely related species in Australia which have both rows more or less straight, as is typical for the other genera grouped together below.

We consider that the four New Zealand genera *Stiphidium*, *Cambridgea*, *Nanocambridgea* and *Ischalea* along with *Corasoides*, *Tartarus*, *Baiami* and *Procambridgea*, known only from Australia, belong in this family. Both cribellate and ecribellate genera are included and the large size of the colulus in the ecribellate genera and its flattened form suggests that the ecribellate state is relatively recent in the phylogeny of the group.

While there is little to suggest any direct lineages from cribellate to ecribellate genera amongst the genera examined there is undoubtedly a close affinity between *Cambridgea* and *Procambridgea*. The absence of a developed median apophysis in *Procambridgea* precludes a direct link with *Cambridgea*. It is possible however to postulate a close common ancestor.

Two types of snare are known for the family. The cribellate genera *Stiphidium* and *Tartarus* construct a large inverted truncated cone with guy threads attached to the margins of the sheet. The spider rests on the substratum within the apex of the cone (Fig. 395). *Cambridgea*, *Nanocambridgea* and *Corasoides* construct a large horizontal sheet guyed with threads below and to the sides and above this sheet are a large volume of knock-down threads. The spiders move on the underside of the sheet in contrast to *Agelena* and *Tegenaria* which move on the upper surface. At first sight the two types of webs appear to be very different but the cribellate web could be transformed into the *Cambridgea* structure if the attachment at the apex was released from the substratum and attached from below. The cribellate spiders do in fact move on the inner surface of the cone which is the undersurface of the sheet. A similar web form would be also attained if the retreat were to be situated at one side of the web.

The characteristics of the family are as follows:

Medium sized to large three clawed spiders with the eyes in two more or less straight rows (*S. facetum* is an exception). Claw tufts and scopulae absent. Spination of the basic pattern with rarely more than three pairs of spines on the ventral surface of the tibiae and metatarsi of the first two pairs of legs. Tarsal organ present. Plumose hairs present or absent. Trichobothria in a double row on tibiae, single on metatarsi and tarsi. Both cribellate and ecribellate spiders are included in the family. Calamistrum when present in a single row. Cribellum with paired spinning fields. Colulus large, usually as a hairy flattened plate which suggests recent derivation from a cribellum. Chelicerae with a lateral boss. Both margins with strong teeth. Basic number, retromargin two, promargin three, but a greater number often present. Trichobothria present on the tarsus of the female palp and the cymbium of the male palp. Bulb of the male palp simple, with the three basic structures, embolus, conductor and median apophysis. The embolus spiniform and slender, straight or evenly curved. The conductor well developed and much more extensive and more heavily sclerotized than the simple membranous structure characteristic of the Amaurobiidae. The median apophysis is of the simple hooked form (*Ischalea*) but shows a strong tendency to reduction, and in some genera it is lost. The epigynum is characterized by a median plate or ridge, which is sometimes reduced to a small median protuberance. Internal genitalia strongly receptaculate. Tracheal spiracle at the base of the spinnerets, small. Tracheal system simple, consisting of four unbranched and slender trachae which are limited to the abdomen.

Type genus *Stiphidium* Simon, 1902.

This family is separated from the Amaurobiidae, as we restrict it, by the presence of a simple hooked median apophysis in the male palp or progressive derivations from this form of median apophysis which are degenerative and lead to the loss of the structure. The Amaurobiidae is characterized by the strong development of the median apophysis, usually flattened, strongly sclerotized and with a tendency to vary considerably in shape.

A firm separation from the Agelenidae is difficult. We have broadened the Agelenidae well beyond the limitations suggested by Lehtinen but nevertheless by stressing the importance of the tracheal system have restricted the limits below those usually accepted by other workers. There are a number of general characteristics of the Agelenidae such as the T-shaped conductor of the male palp, the tendency for the cribellum to become reduced to a conical structure which then gives rise to a small colulus or a paired colulus rather than the plate structure found in the Stiphidiidae and also in the Amphinectidae but when considered at lower taxonomic levels these distinctions become blurred.

Perhaps the most distinctive feature characterizing the Stiphidiidae at present is the form of the snare.

#### KEY TO THE NEW ZEALAND GENERA OF THE FAMILY STIPHIDIIDAE

1. Cribellate. Posterior spinnerets conspicuously longer than anterior pair  
***Stiphidium* Simon**
- Ecribellate. Both anterior and posterior pairs of spinnerets more or less equal in length

**Stiphidium** Simon 1902

1902 *Stiphidium*, Simon. Bull. Soc. ent. Fr. 15: 242.

1958 *Stiphidium*, Bonnet. Bibliogr. Aran. 2: 4170.

Medium sized (body length 6-8mm) cribellate spiders. Carapace with the head region clearly defined but rather low. Raised on the upper portion of the head and the region around the fovea. Both rows of eyes strongly recurved. The eyes stand out from the surface and the AME are relatively large and at times larger than the PME. Chelicerae short and vertical with two teeth on the retromargin and three on the promargin. Lateral boss distinct. Legs very long and slender. Plumose hairs absent. Superior claws strongly pectinate. Inferior claw with few teeth. Trichobothria numerous, in a double row on the tibiae and a single row on metatarsi and tarsi. Calamistrum proximal, absent in male. Cribellum rectangular, wider than long, spinning fields divided, but absent in male. Anterior pair of spinnerets stout and

Fig. 394 Stridulating organ on the ventral surface of the abdomen and petiolus of the male of *Nanocambridgea gracilipes* n.sp.

Fig. 395 Web of *Tartarus mullamullangensis* Gray. Mullamullanga Cave, near Madura, Nullarbor Plain, Australia (Photo M. R. Gray).

well separated. Posterior pair slender with the distal segment as long as basal segment. Epigynum with the typical median ridge. Internal genitalia receptaculate with a short duct. Male palp with a slender spiniform embolus. Conductor very large, T-shaped. Median apophysis absent. Cymbium pointed distally and extending well beyond the bulb but not as pronounced as in other genera.

Type species *Stiphidion facetum*, Simon, 1902.

This typically Australian genus is known from a single species which has undoubtedly been introduced into this country. The relatively long, slender legs, the length of the posterior pair of spinnerets and the fact that it is cribellate makes this genus easy to recognise in this country. A number of related genera are known from Australia.

| Palp | 1.28     | 1.22              |            | 1.22   | 3.72  |  |

**Colour** Dorsal surface as in Fig. 397. Ventrally, two longitudinal black bands, separated by a speckled area, run from the epigynum region to the spinnerets. Spinnerets dark. Sternum distinctly sooty posteriorly. Legs clearly ringed with grey. Chelicerae dark brown.

**Carapace** The carapace is broad and flat. Thoracic region clearly differentiated from the head region which is higher than the thorax. Fovea distinct.

**Eyes** (Fig. 402). The eyes are large. From above both rows are strongly recurved. From in front the anterior row is slightly recurved and the posterior row straight.

Fig. 387 *Stiphidion facetum* Simon female.

Ratio of AME.ALE.PME.PLE = 4.5.3.4. AME separated from each other by 3/4 and from the ALE by 2/4 of the diameter of an AME. Lateral eyes separated by 3/4 of the diameter of an AME. PME separated from each other by 5/4 and from the PLE by 4/4 of the diameter of an AME. MOQ as wide behind as in front and wider behind than long in the ratio of 11.10. Height of clypeus equal to 5/4 of the diameter of an AME and concave.

**Sternum** Scutiform, longer than wide in the ratio of 8.7. Anterior margin gently incurved, lateral margins evenly curved. Posterior projection sharp.

**Labium** Lateral margins converging slightly distally, anterior margin indented. As wide at the base as long.

**Chelicerae** Retromargin with two and promargin with three teeth.

**Palp** Slender with few spines. Femur, d.0.1.1.1. Tibia, p.1.0. Tarsus many. Five trichobothria on the tibia arranged 2.2.1. Tarsal claw with eight teeth.

**Legs** Long and slender. Clothed with strongly ciliate hairs. Spines. First leg. Femur, d.1.1.0.0. p.1.1.0.1. r.0.1.0.1. Tibia, v.2.1.2. p.0.0.1. Metatarsus, v.2.2.2. p.0.0.1. Second leg. Femur, d.1.1.0.0. p.1.1.0.1. r.0.1.0.1. Tibia, v.1.0.2. p.r.0.0.1. Metatarsus, v.2.2.1. p.r.0.1.2. Third leg. Femur, d.1.1.0.0. p.0.0.0.1. Patella, d.1.1. Tibia, v.0.1.2. p.r.0.0.1. d.1.0.0. Figs. 398-402 *Stiphidium facetum* Simon. Fig. 398 Ventral view of male palp. Fig. 399 Tibial processes of male palp. Fig. 400 Epigynum. Fig. 401 Internal genitalia. Fig. 402 Dorsal view of carapace showing eyes.

The snare, an inverted cone, is constructed on the overhanging surfaces of clay banks, rock faces etc. The eggsac is plano-convex, often covered with debris and attached to the substrate.

Undoubtedly introduced from Australia this spider is probably restricted to the North Island although there is one doubtful record from Nelson.

#### *Procambridgea* n.gen.

Medium sized (body length 4-5.5mm) cribellate spiders. Eyes in two more or less straight rows. AME distinctly smaller than remaining eyes. Carapace typical for the family with the head region clearly defined. Chelicerae with from 6-7 teeth on each margin. Lateral boss well defined. Legs long and slender, without plumose hairs. Trochantera notched. Trichobothria numerous, in a double row on tibiae and single row on metatarsi and tarsi. Superior claws strongly pectinate. Inferior claw with few teeth. Calamistrum proximal, absent from the male. Cribellum with divided spinning fields, absent from the male. Epigynum with a median ridge. Internal genitalia receptaculate with well developed ducts which open anteriorly. Male palp long and slender with the distal portion of the cymbium slender and extending well beyond the bulb. Embolus originating distally, slender, spiniform. Conductor large, a membranous plate. Median apophysis greatly reduced or absent.

Type species *Procambridgea rainbowi* n.sp.

This group is entirely Australian and the two species are described below to provide a source of comparison with the ecribellate *Cambridgea* of New Zealand. The genus seems most closely related to *Tartarus* but may be separated by the

distal origin of the embolus, the notched trochantera and the absence of plumose hairs. The relationship of this genus with the ecribellate *Cambridgea* and *Nanocambridgea* is also clear. Apart from the fact that these spiders construct a sheet web little is known of their habits.

| 1    | 2.3      | 0.7         | 2.2        | 1.9        | 1.4    | 8.5   |
| 2    | 2.0      | 0.6         | 1.7        | 1.6        | 1.2    | 7.1   |
| 3    | 1.7      | 0.6         | 1.4        | 1.6        | 1.0    | 6.3   |
| 4    | 2.2      | 0.6         | 1.9        | 2.2        | 1.2    | 8.1   |
| Palp | 0.9      | 0.4         | 0.6        |            | 0.9    | 2.8   |

**Colour** Carapace dull yellow brown with dark shading on the lateral margins of the thorax and in the vicinity of the median fovea from which a pair of vein-like markings diverge forward to the lateral eyes. Chelicera slightly darker than the carapace. Legs with broad black bands. Abdomen heavily shaded with black. On the median anterior half there is a pale area which has a median dark band which terminates with a pair of white spots. Mid ventral surface pale with dark flecks but the surface is darker posteriorly. Anterior spinnerets black but posterior spinnerets white.

**Carapace** Mostly well covered with rather long hair with a few small bristles on the dorsal surface.

**Eyes** the group occupies 2/3 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row is recurved and the posterior row straight. Ratio of AME:ALE:PME:PLE = 3.5:5.5. AME separated from each other and from the ALE by a distance equal to 1/3 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/3 and from the PLE by 3/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 14.7 and wider behind than long in the ratio of 14.12. Height of clypeus equal to 7/3 of the diameter of an AME.

**Sternum** As wide as long. The posterior projection separates the posterior coxae by a distance equal to 2/3 of the diameter of a coxa.

**Maxillae** Longer than wide in the ratio of 25.14 and twice the length of the labium.

**Labium** As wide as long. Distal margin slightly indented.

**Chelicerae** The promargin has a carina which ends distally in a tooth followed by a large tooth and four

or five minute teeth. The retromargin has seven small contiguous teeth which decrease in size towards the base of the fang.

**Palp** Spines. Femur, d.0.1.1. p.1. r.0. Patella, d.1.1.1. Tibia, p.1.0. d.1.1. Tarsus, numerous. Trichobothria. Tibia, 2.2.2.2. Tarsus, 4.

**Legs** Spines short and rather stout. Without plumose hairs. Trochantera notched. Spines. First leg. Femur, d.1.1.0. p.0.1.1. r.0.0.1. Patella, 1.1. Tibia, v.1.0. d.1.1. p.0.1. r.0. | Palp    | 2.6        | 1.1        | 1.6 1.9 7.2                   |

**Colour** Carapace and chelicerae pale yellowish cream. legs paler without markings. Sternum and mouthparts almost white. Abdomen very pale grey with slight mottling.

**Carapace** Well covered with hair.

**Eyes** The group occupies 2/3 of the width of the head. From in front the anterior row is slightly recurved and the posterior row procurved. From above the posterior row is straight and the anterior row recurved. Ratio of AME:ALE:PME:PLE = 3.4:4.4. AME separated from each other by a distance equal to 1/3 and from the ALE by 2/3 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/3 and from the PLE by 2/3 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/3 and from the PLE by 3/3 of the diameter of an AME. MOQ wider behind than in front in the ratio of 12.7 and wider behind than long in the ratio of 12.11. Height of clypeus equal to 7/3 of the diameter of an AME.

**Sternum** Scutiform. As wide as long. Anterior margin indented. The posterior projection separates the posterior coxae by a distance equal to 2/3 of the diameter of a coxa.

**Maxillae** Longer than wide in the ratio of 30.15 and twice the length of the labium. Inclined over labium. Outer margins slightly convex.

**Labium** As wide as long. Distal margin indented.

**Chelicerae** Similar to *P. rainbowi*.

**Palp** The tibial processes and bulb are shown in Figs. 407, 408. Distal portion of cymbium extremely long and slender.

**Legs** Trochantera notched. Spines. Similar to those of the female, except there is no calamistrum.

Resembles the male in general characteristics.

**Legs** Spines. First leg. Femur, d.0.1.0. p.r.0.1.1. Tibia, v.0.2.0. p.r.0.0. Metatarsus, v.1.2 and distally 2 (v.1. p.1.) p.r.0. Second leg. Femur, d.1.1.0. p.r.0.0.1. Tibia, v.1.2.0. p.0.1. r.0. Metatarsus, v.0.2 and distally 4 (v.1. p.2. r.1.) p.1 median. Third leg. Femur, d.1.1.0. p.r.0.0.1. Tibia, v.1.1.2. p.d.1.1. r.0.1. Metatarsus, v.1.2 and distal sub-whorl of 5, p.1.1. r.0.1. Fourth leg. Femur, d.1.0.0. p.r.0.0.1. Tibia and metatarsus same as third leg. Calamistrum occupies 1/3 of the metatarsus.

**Abdomen** Cribellum divided but spinning fields difficult to see. Epigynum and internal genitalia are shown in Figs. 409, 410.

**Types** Holotype male, allotype female. New South Wales, Australia. Signatore Cave, Wee Jasper, N.S.W., 2.vi.1962, E. Hamilton-Smith (Australian Museum, Sydney).

**Records** New South Wales, Australia. Far chamber, Punch Bowl Cave, Wee Jasper, 12.viii.1961, E. Hamilton-Smith. Twilight zone, Church Cave, Wee Jasper, 3.vi.1962, E. Hamilton-Smith.

This species is probably restricted to caves. Pigment is almost lost and the legs are relatively longer and more slender than *rainbowi*.

Medium sized to large (body length 8-20mm) scribellate spiders. Head region of carapace distinct. Eyes in two more or less straight rows. AME only slightly smaller than remaining eyes. Chelicerae with a strong lateral boss. Promargin with two teeth, retromargin with from 3-5 teeth but usually four. Often much larger and porrect in the male. Legs long and slender, without

Figs. 411-414 *Cambridgea fasciata* L. Koch. Fig. 411 Ventral view of male palp. Fig. 412 Tibial processes of male palp. Fig. 413 Epigynum. Fig. 414 Internal genitalia.

plumose hairs. Trochanters of legs 2-4 with a very shallow notch. Superior claws strongly pectinate. Inferior claw with few teeth. Colulus a large, flat plate similar in appearance to the cribellum of *Procambidgea*. Males often with a stridulating organ in the form of an erect projection from the anterior plate of the lorum of the pedicel which engages with a series of sclerotized ridges on the anterior overhang of the abdomen. This structure is not present in all species. Epigynum characteristically with a median furrow while the median ridge is represented by an anteriorly situated lobe. Internal genitalia receptaculate with short ducts which open anteriorly. The male palp is long and slender with the distal portion of the cymbium narrowing and extending well beyond the bulb. Embolus spiniform, originating from the pro-lateral margin of the bulb. Conductor well developed and membranous. The median apophysis is poorly developed and virtually absent in some species. Distal segment of posterior spinnerets shorter than basal segment. The snare is the same in all species recorded. It consists of a large horizontal sheet held with lateral and ventral guylines. The ventral lines pull out the sheet into characteristic inverted domes. Above the sheet is an extensive network of knock-down threads. The spider moves on the ventral surface of the sheet.

Type species *Cambridgea fasciata*, L. Koch, 1872.

This genus includes some of the most commonly seen endemic spiders. A number of species

construct their webs in hedges and shrubs in gardens, in sheds or under houses. During the latter half of the summer when the males reach maturity they are often found wandering about inside the house.

|      |          |             |           | 25.7       |
|      |          |             |           | 20.9       |
|      |          |             |           | 17.5       |
|      |          |             |           | 22.4       |
|      |          |             |           | 9.1        |

**Colour** The general pattern is shown in Fig. 388.

**Eyes** The group occupies 9/16 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row is slightly recurved and the posterior row straight. Ratio of AME:ALE:PME:PLE = 12.13.12.12. AME separated from each other by a distance equal to 7/12 and from the ALE by 8/12 of the diameter of an AME. Laterals narrowly separated. PME separated from each other and from the PLE by the diameter of an AME. MOQ wider behind than in front in the ratio of 36.31 and longer than wide behind in the ratio of 40.36. Height of clypeus equal to the diameter of an AME.

**Sternum** Longer than wide in the ratio of 60.48. The posterior projection separates the posterior coxae by slightly less than half the diameter of a coxa.

Figs. 415-418 *Cambridgea antipodiana* (White). Fig. 415 Ventral view of male palp. Fig. 416 Tibial processes of male palp. Fig. 417 Epigynum. Fig. 418 Internal genitalia.

**Chelicerae** Promargin of groove with four teeth, the second tooth from the fang very small. Retromargin with two teeth.

**Palp** Spines. Femur, d.1.1.1. p.r.1 patella, 1 (bristle) 1. Tibia, d.p.1.1. r.0.0. Tarsus, numerous. Trichobothria. Tibia, anterior surface 4.2.1, posterior surface 3.2.1.1.1. Tarsus, 1.1.1.1.1.1. Claw with ten teeth.

**Legs** Trochanters of third and fourth pairs notched. Spines and trichobothria typical.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 417, 418.

Marlborough. Picton, 23.iii.1969, R.R.F., C.L.W. Motu Ngaratiti Is., 12.ix.1948, R. K. Dell.

This is the most commonly found species in the South Island. In the North Island it is only found near Wellington. In the northern parts of the North Island this species is replaced by *fasciata*.

There seems to be two forms of male distinguished by the size of the chelicerae. One form is similar to the female but in the other the chelicerae are very large and porrect. Apart from this difference the two forms are structurally similar.

Figs. 387, 411-414

#### FEMALE

##### Measurements

| Carapace | length 3.5 | width 2.5 |
|----------|------------|-----------|
| Abdomen  | length 5.7 | width 4.1 |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 4.8   | 1.4     | 5.0   | 4.0        | 2.3    | 17.5  |
| 2    | 3.7   | 1.2     | 3.3   | 3.0        | 1.7    | 12.9  |
| 3    | 3.0   | 1.1     | 2.5   | 2.7        | 1.4    | 10.7  |
| 4    | 4.2   | 1.2     | 3.6   | 4.0        | 2.0    | 15.0  |
| Palp | 1.7   | 0.6     | 1.0   |            | 1.6    | 4.9   |

**Colour** Dorsal pattern as shown in Fig. 387. The paler areas are pale brownish cream and the darker areas dark brown.

**Eyes** The group occupies 3/5 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row is slightly recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 7.10.9.10. AME separated from each other by a distance equal to 3/7 and from the ALE by 4/7 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 5/7 and from the PLE by 4/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.17 and longer than wide behind in the ratio of 26.23. Height of clypeus equal to 8/7 of the diameter of an AME.

**Sternum** Longer than wide in the ratio of 40.32. The posterior projection separates the posterior coxae by a distance equal to 1/3 of the diameter of a coxa.

**Maxillae** Longer than wide in the ratio of 25.16 and twice the length of the labium.

**Labium** Wider than long in the ratio of 13.12. Distal margin broadly indented.

**Chelicerae** Retromargin with two teeth, promargin with four teeth one of which is very small.

**Palp** Spines. Femur, d.l.l.l. p.r.l. Patella, l.l. Tibia, d.p.l.l. r.o.o. Numerous on tarsus. Trichobothria. Tibia, 6.4.2.1. Tarsus, 1.1.1.1.1.1. Claw with seven teeth.

**Legs** The trochanters of the posterior two pairs of legs are notched. Spines. First leg. Femur, d.p.l.l.l. r.l.o.l. Tibia, v.2.2.2. p.l.l. r.l.o. Metatarsus, v.2.2 and a distal subwhorl of 3, p.l median, r.o. Second leg. Femur, d.p.l.l.l. r.l.o.l. Tibia, v.2.2.2. p.r.l.l. Metatarsus, v.2.2 and a distal subwhorl of 4. 2 on prolateral surface and one each on the ventral and retrolateral surfaces, p.l.l.

Figs. 419-422 *Cambridgea agrestis* n.sp. Fig. 419 Ventral view of male palp. Fig. 420 Tibial processes of male palp. Fig. 421 Epigynum. Fig. 422 Internal genitalia.

r.o.l. Third leg. Femur and tibia as for second leg. Metatarsus, v.2.2. and subwhorl of 5, p.r.l.l. Fourth leg. Femur, d.l.l.l. p.l.o.l. r.o.o.l. Tibia, v.l.l.2. p.l.l. r.l.o. Metatarsus, v.2.2 and subwhorl of 5, p.r.l.l. Superior claw with about 12 teeth and the inferior claw with three.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 413, 414.

#### MALE

##### Measurements

|         | Carapace   | length 3.2 | width 2.4 |
|---------|------------|------------|-----------|
| Abdomen | length 3.5 | width 2.0  |           |
| Leg     | Femur      | Patella    | Tibia     |
| 1       | 5.1        | 1.3        | 5.3       |
| 2       | 4.1        | 1.1        | 3.7       |
| 3       | 3.4        | 1.0        | 2.7       |
| 4       | 4.4        | 1.1        | 4.0       |
| Palp    | 1.9        | 0.6        | 0.8       |

In general characteristics the male resembles the female.

**Palp** The tibial processes and the bulb are shown in Figs. 411, 412.

**Chelicerae** There is a protuberance on the anterior surface near the base of the fang.

**Abdomen** The stridulating organ is similar to that of *antipodiana*.

**Types** Although Koch gives Canterbury as the locality from which the holotype female was collected, Cambridge (1873, p. 203) states that the specimen examined by Koch was a small example from a collection of several females collected by Captain Hutton in the Waikato. This specimen is in the Cambridge collection. Plesio-type male. Waikato. Matamata, 22.viii.1970, D. Court (Otago Museum). Female described and figured. Waikato. Cambridge, slopes leading to Lake, 15.viii.1953, B. J. Marples (Otago Museum).

**Records** North Island. Hen Is., January 1968, M. Grantham. Auckland. Titirangi, 12.xii.1945,

#### *Cambridgea agrestis* n.sp.

Figs. 419-422

#### MALE

##### Measurements

|         | Carapace   | length 4.6 | width 3.3 |
|---------|------------|------------|-----------|
| Abdomen | length 6.0 | width 3.2  |           |
| Leg     | Femur      | Patella    | Tibia     |
| 1       | 5.0        | 1.9        | 5.8       |
| 2       | 4.9        | 1.7        | 4.5       |
| 3       | 4.1        | 1.4        | 3.3       |
| 4       | 5.0        | 1.5        | 4.4       |
| Palp    | 2.5        | 0.7        | 0.9       |

**Colour** The carapace is strongly marked. The legs have only faint indications of bands confined to the posterior pairs. The abdomen is rather pale with the typical pattern obscure.

**Eyes** The group occupies 4/7 of the width of the head. From in front the anterior row is very slightly recurved and the posterior row procurved. From above the anterior row is slightly recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 8.11.8.10. AME separated from each other and from the ALE by a distance equal to 4/8 of the diameter of an AME. Laterals narrowly separated. PME separated from each other and from the PLE by 7/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 23.20 and longer than wide behind in the ratio of 29.23. Height of clypeus equal to the diameter of an AME.

**Sternum** Longer than wide in the ratio of 50.38. The posterior projection separates the posterior coxae by half the diameter of a coxa.

**Chelicerae** Promargin with four teeth and the retromargin with two teeth.

**Palp** The tibial processes and the bulb as shown in Figs. 419, 420.

**Legs** Typical

**Abdomen** The stridulating organ is strongly sclerotised as in *C. antipodiana* but has only three ridges.

#### FEMALE

##### Measurements

| Carapace | length 3.6 | width 2.6 |
|----------|------------|-----------|
| Abdomen  | length 4.4 | width 2.8 |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 4.2   | 1.5     | 4.2   | 3.6        | 2.0    | 15.5  |
| 2    | 3.6   | 1.3     | 3.0   | 2.8        | 1.7    | 12.4  |
| 3    | 3.0   | 1.1     | 2.3   | 2.5        | 1.2    | 10.1  |
| 4    | 3.8   | 1.2     | 3.4   | 3.7        | 1.9    | 14.0  |
| Palp | 1.6   | 0.7     | 1.0   |            | 1.6    | 4.9   |

Resembles the male in general characteristics.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 421, 422.

**Types** Holotype male. Otago. Pitfall trap, Naseby-Kyeburn Diggings Road, 16.ii.1969, C. L. Wilton. Allotype female. Otago. Pitfall trap, Deep Dell, 9.ii.1968, C. L. Wilton (Otago Museum).

**Record** Same data as holotype.

## MALE

### Measurements

|      | Carapace | Abdomen | length 3.8 | width 2.7  |        |       |
|------|----------|---------|------------|------------|--------|-------|
|      |          |         | length 5.0 | width 2.7  |        |       |
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus | Total |
| 1    | 4.5      | 1.6     | 4.8        | 4.4        | 2.3    | 17.6  |
| 2    | 3.9      | 1.4     | 3.5        | 3.4        | 1.6    | 13.8  |
| 3    | 3.4      | 1.2     | 2.7        | 3.0        | 1.5    | 11.8  |
| 4    | 4.3      | 1.3     | 3.9        | 4.4        | 1.9    | 15.8  |
| Palp | 2.0      | 0.6     | 0.8        |            | 2.1    | 5.5   |

**Colour** Carapace pattern very strongly marked. Leg banding discernible slightly on the posterior pairs of legs. Abdomen generally pale with a row of black spots from the mid-dorsal region towards the spinnerets. Lateral and posterior surfaces lightly shaded.

**Eyes** The group occupies 3/5 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row is slightly recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 7.9.8.9. AME separated from each other by a distance equal to 3/7 and from the ALE by 4/7 of the diameter of an AME. Laterals narrowly separated. PME separated from each other and from the PLE by 6/7 of the diameter of an AME. MOQ

## MALE

### Measurements

|      |          |         |            |            |        |       |
|------|----------|---------|------------|------------|--------|-------|
|      | Carapace |         | length 4.5 | width 3.1  |        |       |
|      | Abdomen  |         | length 5.2 | width 2.8  |        |       |
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus | Total |
| 1    | 5.7      | 1.8     | 6.2        | 5.3        | 3.0    | 22.0  |
| 2    | 4.7      | 1.6     | 4.3        | 4.0        | 2.3    | 16.9  |
| 3    | 4.0      | 1.4     | 3.4        | 3.7        | 1.9    | 14.4  |
| 4    | 5.0      | 1.5     | 4.5        | 5.2        | 2.5    | 18.7  |
| Palp | 2.5      | 0.8     | 1.0        |            | 2.5    | 6.8   |

**Colour** Carapace creamy yellow with a broad median band and lateral marginal bands. The median band fades slightly anteriorly and posteriorly does not reach petiolus. The posterior pairs of legs are slightly marked with bands. Abdominal pattern typical but rather obscure.

**Eyes** The group occupies 4/7 of the width of the head. From in front the anterior row is slightly recurved and the posterior row procurved. From above the anterior row is slightly recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 8.11.10.10. AME separated from each other by a distance equal to 3/8 and from the ALE by 4/8 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/8 and from the PLE by 5/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 24.19 and longer than wide behind in the ratio of 29.24. Height of clypeus equal to the diameter of an AME.

**Chelicerae** Promargin with four teeth of fairly even size and spacing. Retromargin with two teeth.

**Palp** Trichobothria. Tibia, 6.4.2.1, cymbium, 1.1.1.1.1.1. The tibial processes and bulb are shown in Figs. 439, 440.

**Legs** Trochanters slightly notched. Spines rather slender and sharp and on the anterior pairs of legs the long erect hairs are curved. Spination typical except that the subwhorl on the metatarsus of the second pair consists of 5 instead of 4 spines which is the usual number found in the *antipodiana* and *arboricola* groups.

**Abdomen** The stridulating organ appears to be an undeveloped form of that of *antipodiana*. There are five unsclerotized ridges.

## FEMALE

The epigynum illustrated (Fig. 436) is of a female from Open Bay Is. which probably is this species.

**Type** Holotype male. Westland. Rough River, Ikamatua, Greymouth, 4.iv.1956, L. R. Jackson (Otago Museum).

# Cambridgea peculiaris n.sp.

Figs. 437-438

## MALE

### Measurements

|      |          |         |            |            |        |       |
|------|----------|---------|------------|------------|--------|-------|
|      | Carapace |         | length 4.2 | width 2.9  |        |       |
|      | Abdomen  |         | length 5.0 | width 2.0  |        |       |
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus | Total |
| 1    | 6.9      | 1.6     | 7.5        | 6.9        | 3.3    | 26.2  |
| 2    | 5.3      | 1.4     | 5.0        | 4.8        | 2.5    | 19.0  |
| 3    | 4.4      | 1.2     | 3.6        | 4.1        | 2.0    | 15.3  |
| 4    | 5.4      | 1.4     | 5.1        | 5.9        | 2.8    | 20.6  |
| Palp | 2.7      | 0.7     | 1.1        |            | 2.8    | 7.3   |

**Colour** Carapace creamy yellow with a slight orange tinge. Black bands originate at the PME and PLE on each side and unite behind the median fovea and continue as a single band to the posterior margin. There is a black

band on each lateral margin. PME each on a black spot as are each pair of the lateral eyes and the AME. Chelicerae same colour as the carapace with dark shading on the anterior surface. Legs pale with dark shading which becomes bands on the posterior pairs. Abdomen pale cream on the anterior half and becoming dark olive grey on the posterior half. On each side there is a dark band which follows the lateral shape of the abdomen and merges with the dark posterior surface. Within the pale space enclosed by these bands are two short bands extending forward for a short distance from the dark posterior half.

**Eyes** The group occupies 3/5 of the width of the head. From in front the anterior row is slightly recurved and the posterior row procurved. From above the anterior row is recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 6.9.8.9. AME separated from each other by a distance equal to 3/6 and from the ALE by 4/6 of the diameter of an AME. Laterals narrowly separated. PME separated from each other and from the PLE by 3/6 of the diameter of an AME. MOQ wider behind than in front in the ratio of 19.15 and longer than wide behind in the ratio of 24.19. Height of clypeus equal to 5/6 of the diameter of an AME.

**Chelicerae** Promargin with four small teeth which are evenly spaced and nearer to the base of the segment than they are to the fang. First and third teeth very small. Retromargin with two teeth.

**Palp** Trichobothria. Tibia, p.2.2.2.1, r.2.2.1.1.1. Cymbium, 1.1.1.1.1.1.1. The tibial processes and the bulb are shown in Figs. 437, 438.

**Legs** The trochanters are notched. The long hairs on the anterior pairs of legs are curved. The spination is typical except that the metatarsus of the second pair of legs has a distal subwhorl of five spines. Inferior claws of a first leg with four teeth and superior claw twelve teeth.

**Abdomen** There are no stridulating ridges.

**Type** Holotype male. North Auckland. Pitfall trap, Mimiwhangata, Bay of Islands, 10-17.xii.1970, J. Darby (Otago Museum). Paratype males, same data.

The embolus of the palp is different in form from other known species of *Cambridgea* or allied genera but otherwise is typical.

### Measurements

|      |          |         |            |            |        |       |
|------|----------|---------|------------|------------|--------|-------|
|      | Carapace |         | length 3.6 | width 2.9  |        |       |
|      | Abdomen  |         | length 4.8 | width 2.5  |        |       |
| Leg  | Femur    | Patella | Tibia      | Metatarsus | Tarsus | Total |
| 1    | Missing  |         |            |            |        |       |
| 2    | 5.2      | 1.5     | 4.8        | 4.4        | 2.5    | 18.4  |
| 3    | 4.2      | 1.4     | 3.2        | 3.7        | 2.0    | 18.7  |
| 4    | 5.3      | 1.4     | 4.7        | 5.2        | 2.6    | 19.2  |
| Palp | 2.2      | 0.7     | 1.0        |            | 2.3    | 6.2   |

**Colour** Carapace pale yellowish brown with a broad brown median band extending from the eyes to the posterior margin. There is a narrow brown band on each lateral margin. Only slight banding on the legs. Abdomen pale but darkening on the lateral and posterior slopes. There is a dark longitudinal band on each side which gradually merges with the darker posterior surface. Ventral surface clearly defined from the lateral surfaces and posterior spinnerets are darker than the anterior spinnerets.

**Eyes** The group occupies 2/3 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row

is slightly recurved and the posterior row straight. Ratio of AME.ALE.PME.PLE = 8.10.9.10. AME separated from each other by a distance equal to 3/8 and from the ALE by 2/8 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 4/8 and from the PLE by 6/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 22.19 and longer than wide behind in the ratio of 27.22. Height of the clypeus equal to 7/8 of the diameter of an AME.

**Chelicerae** Relatively short and stout. The teeth resemble those of a female of *antipodiana*. **Palp** The tibial processes and the bulb are shown in Figs. 441-442.

**Legs** The coxa of a fourth leg with a protuberance on the basal posterior surface. The trochanters are broadly notched. Second leg. Femur, d.p.1.1.1. r.1.0.1. Tibia, v.p.1.1.1. r.0.1.1. Metatarsus, v.2.2, and a distal subwhorl of 4, p.1.1. r.0.1. Third leg. Femur, d.p.r.1.1.1. Patella, 1.1. Tibia, v.1.2.2, d.p.r.1.1. Metatarsus, v.2.2 and subwhorl of 5, p.r.1.1. Fourth leg. Femur, d.1.1.1. p.1.0.1. r.0.1.1. Patella, tibia and metatarsus the same as the third leg. Trichobothria. Second leg. Tibia, p.3.2.1. r.2.1.1.1.1. Metatarsus, 1.1.1.1.1.1. Tarsus, 1.1.1.1.1.1.1. Inferior claw with three teeth and superior claws with thirteen.

**Abdomen** The colulus is semicircular and as wide as long. The stridulating organ is sclerotized, with five ridges but is much smaller and simpler than that of *antipodiana*.

**Types** Holotype male. North Auckland. Mangamuka Gorge, in bush, 19.ix.1953, B. J. Marples (Otago Museum).

# Cambridgea foliata (L. Koch) 1872

| 4    | 8.4      | 2.8     | 6.6         | 6.8        | 2.8    | 27.4 |
| Palp | 4.0      | 1.4     | 2.4         |            | 3.4    | 11.2 |

**Colour** (Fig. 443). Carapace and chelicerae uniform reddish brown. The abdomen is a uniform greyish yellow with the posterior dorsal surface darker. The legs are orange brown.

**Carapace** The width of the head is equal to 5/8 of the width of the thorax. Lateral margins of the head straight and parallel, extending back one fifth of the length of the carapace. Fovea distinct.

**Eyes** The eyegroup occupies one half of the width of the head. From above the anterior row is recurved and the posterior row slightly procurved. Ratio of AME.

Fig. 443 *Cambridgea foliata* (L. Koch) female.

ALE.PME.PLE = 10.10.9.10. AME separated from each other by a distance equal to 5/10 and from the ALE by 3/10 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 9/10 and from the PLE by 7/10 of the diameter of an AME. MOQ wider behind than in front in the ratio of 27.25 and longer than wide behind in the ratio of 31.27. Height of clypeus equal to 8/10 of the diameter of an AME.

**Sternum** The anterior margin is gently incurved and the lateral margins evenly curved to the posterior margins of coxae 3 where they slope sharply to the posterior projection. The posterior projection is relatively long and separates coxae 4 by a distance equal to 3/7 of the width of a coxa.

**Maxillae** The inner margins are curved in over the labium and the outer margins are straight. Anterior margin evenly curved. Scopula thick. Twice as long as wide.

**Labium** Notched at the base. Lateral margins straight and convergent. Anterior margin straight. As long as wide.

**Chelicerae** The length of the chelicerae is equal to 4/9 of the length of the carapace. Lateral boss strong. Proximal portion of the chelicera swollen. Retromargin with two closely spaced teeth. Promargin with three teeth.

**Palp** Spines. Femur, d.1.1.1.1. p,r.0.0.1. Tibia p.1.1. d.1.0.

**Legs** Clothed with short plumose hairs and longer smooth hairs. Spines. First leg. Femur, d.1.1.0.1 p,r.0.1.1. Tibia, v.2.2.2.1.2. p.1.0.1.1.0. r.0.1.1.0.1. Metatarsus, v.2.2.1. p.1.0.1. r.0.1.1. Second leg. Femur d.1.1.0.1. p.1.1.1.1. r.0.1.1.1. Tibia, v.2.1.2.1.2. p.0.1.1.1.0. r.0.1.0.1.0. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. Third leg Femur, d.1.1.0.0.1. p.1.1.1.1.1. r.0.1.1.1.1. Tibia, v.2.2.2.2 p,r.1.0.1.0. Metatarsus, v.2.2.1. p,r.1.1.2. d.0.1.0. Fourth leg. Femur, d.1.1.0.1. r.0.0.1.1. Tibia, v.2.2.2. p,r.0.1.1 Metatarsus, v.2.2.1. p,r.1.1.2. Trichobothria are numerous and similar to *antipodiana*.

**Abdomen** The epigynum and internal genitalia are distinctive as shown in Figs. 446, 447. The anterior spinnerets are stout and squat while the posterior pair are more slender and slightly longer. The colulus is large and flat, with the posterior margin evenly curved. The spiracle is distinct and situated at the base of the spinnerets.

#### MALE

##### Measurements

|      | Carapace | length  | width | length     | width  | Total |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | 10.0    | 7.2   | 9.2        | 5.4    |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus |       |
| 1    | 12.0     | 3.6     | 14.0  | 12.8       | 6.2    | 48.6  |
| 2    | 10.8     | 3.4     | 10.0  | 8.8        | 4.2    | 37.2  |
| 3    | 8.4      | 2.4     | 6.8   | 7.6        | 3.6    | 28.8  |
| 4    | 10.6     | 2.8     | 8.8   | 4.2        | 8.8    | 35.2  |
| Palp | 5.6      | 1.4     | 1.8   |            | 6.2    | 15.0  |

With most of the characters of the female. Usually larger than the female. The chelicerae are relatively longer, equal to 17/25 of the length of the carapace. Retromargin with two teeth but promargin with four teeth with a small extra tooth placed between the distal two. Palp is as shown in Figs. 444, 445. No abdominal stridulating organ.

**Type** Location of the type of *Tegenaria foliata* L.Koch. not known.

This large and conspicuous spider is widespread in the North Island but occurs only in the Nelson-Marlborough and north Westland regions of the South Island. The webs are typical in form but very large. The sheet may at times be up to 3 feet in width. Commonly found within forest this species rarely lives in settled areas. The web is usually constructed from a secure retreat, such as a hole in a tree trunk.

##### Measurements

|      | Carapace | length  | width | length     | width  | Total |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | 6.2     | 4.4   | 5.8        | 4.8    |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus |       |
| 1    | 7.4      | 2.4     | 6.6   | 6.0        | 3.4    | 25.8  |
| 2    | 5.2      | 2.0     | 4.8   | 4.4        | 2.6    | 19.0  |
| 3    | 5.2      | 2.0     | 4.4   | 4.4        | 2.4    | 18.4  |
| 4    | 6.4      | 2.0     | 5.2   | 6.6        | 3.0    | 23.2  |
| Palp | 2.9      | 1.1     | 1.8   |            | 3.2    | 9.0   |

**Colour** The carapace is similar to *turbotti* but the pale area in the median band is absent. Legs banded. Abdomen with grey shading leaving a pale area on the antero-dorsal surface and four longitudinal pale streaks on the ventral surface. Chelicerae and maxillae dark red brown.

**Carapace** Width of the head equal to 7/11 of the width of the thoracic region. Lateral margins of the head straight and parallel, extending back one quarter of the length of the carapace.

Figs. 448-451 *Cambridgea plagiata* n.sp. Fig. 448 Ventral view of male palp. Fig. 449 Tibial processes of male palp. Fig. 450 Epigynum. Fig. 451 Internal genitalia.

**Eyes** Eyegroup placed on a slightly raised area which occupies 9/14 of the width of the head. From above the posterior row is straight and the anterior row slightly recurved and the posterior row is slightly procurved. Ratio of AME.ALE.PME.PLE = 7.10.7.10. AME separated from each other by a distance equal to 5/7 and from the ALE by 3/7 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 7/7 and from the PLE by 6/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 21.19 and longer than wide behind in the ratio of 25.21. Height of clypeus equal to 5/7 of the diameter of an AME.

**Sternum** The anterior margin is straight and the lateral margins undulate. The posterior projection is long and sharp and separates coxae 4 by a distance equal to one half of the width of a coxa.

**Maxillae** Lateral margins straight and slightly divergent. Anterior margin rounded. Scopula thick. Longer than wide in the ratio of 5.3.

**Labium** Notched at the base. Lateral margins straight and convergent. Anterior margin straight. As long as wide.

**Chelicerae** Length of the chelicerae equal to 17/31 of the length of the carapace. Retromargin with two teeth. Promargin with five teeth.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 450, 451. Colulus large and flat evenly curved posteriorly.

Similar in most characters to the female. The palp is shown in Figs. 448, 449. The length of the chelicerae is equal to 11/18 of the length of the carapace, teeth as in female. The spinous process is present on the lorum but much smaller than in *antipodiana*. The postero-dorsal surface of the abdomen is wrinkled and slightly sclerotized but does not form definite ridges.

**Types** Holotype male. Hawkes Bay, Kereru, Poporangi Ck, 17.ii.1954, J. S. Dugdale (Otago Museum). Allotype female. West Taupo, Upper Waihaha Valley, in sink hole, 4.xi.1953, R. K. Dell (Dominion Museum).

| Palp | 2.4      | 1.0        | 1.6 2.2 7.2                   |

**Colour** Carapace with a broad reddish brown band extending from the eyes to the posterior margin and a similar brown band extending around each lateral margin. Mid surface of the median band from the eyes to

the fovea paler than the rest of the head. Lateral areas enclosed by the bands are pale yellow. Legs conspicuously banded with dark brown. Chelicerae reddish brown. Abdomen uniform greyish brown.

**Carapace** Width of the head equal to 2/3 of the width of the thoracic region. Lateral margins of the head straight and parallel extending back one quarter of the length of the carapace. Fovea long, with margins slightly raised.

**Eyes** The eyegroup occupies 7/12 of the width of the head. From above the posterior row is slightly procurved and the anterior row more strongly recurved. From in front both rows appear procurved. Ratio of AME.ALE.PME.PLE = 21.28.24.29. AME separated from each other and from the ALE by a distance equal to 11/21 of the diameter of an AME. Lateral eyes contiguous. PME separated from each other by 21/12 and from the PLE by 17/21 of the diameter of an AME. MOQ wider behind than in front in the ratio of 69.53 and longer than wide behind in the ratio of 77.69. Height of clypeus equal to 22/21 of the diameter of an AME.

**Sternum** Longer than wide in the ratio of 13.11. The anterior margin straight and the lateral margins slightly undulate. Posterior projection relatively long and slender but rounded distally, separating coxae 4 by a distance equal to one half of the width of a coxa.

**Chelicerae** Length of the chelicerae equal to 7/13 of the length of the carapace. Retromargin with two closely spaced distal teeth. Promargin with four teeth at the proximal end of the groove.

**Palp** Spines. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, p.1.1. d.1.0. Trichobothria. Tibia, 2.2.1. Tarsus, 1.1.1.1.1.1.1. Claw with 12 small uniform teeth.

| Palp | 1.8      | 0.7        | 1.2 1.7 5.4                   |

**Colour** Carapace pale cream with a broad median band and lateral bands. The median band is divided longitudinally between the PME and the fovea. The posterior pairs of legs are banded. Abdomen pale anteriorly becoming darker on the lateral and posterior slopes. On each side there is a dark band which follows the lateral outline of the abdomen and merges with the darker areas posteriorly. Between these bands a series of dark flecks or spots converge from each side to meet mid-dorsally and continue as a single row posteriorly. Ventral surface uniformly brownish grey and separated from the lateral surfaces on each side by a row of white spots. No marked differences in colour between the anterior and posterior spinnerets.

**Eyes** The group occupies 3/5 of the width of the head. From in front the anterior row is straight and the posterior row procurved. From above the anterior row is recurved and the posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 7.10.8.9. AME separated from each other and from the ALE by a distance equal to 3/7 of the diameter of an AME. Laterals are narrowly separated. PME separated from each other by 5/7 and from the PLE by 4/7 of the diameter of an AME. MOQ wider behind than in front in the ratio of 21.17 and longer than wide behind in the ratio of 25.21. Height of clypeus equal to 6/7 of the diameter of an AME.

**Chelicerae** Typical. Teeth on promargin slightly more separated than in *antipodiana*.

**Palp** Trichobothria. Tibia, p.2.2.1. r.3.2.1.1.1. Cymbium, 1.1.1.1.1.1. Claw with seven teeth.

**Legs** Trochantera notched. Long hairs on anterior pairs curved. Metatarsus of a second leg with a distal subwhorl of 5 spines.

**Abdomen** The epigynum and internal genitalia are shown in Figs. 456, 457.

**Type** Holotype female. North Auckland. Cape Reinga, 7.i.1967, R. R. Forster (Otago Museum).

**Colour** Cephalothorax and chelicerae dark red brown. Legs uniform orange brown. Abdomen cream with black shading except for the antero-dorsal surface and two pale patches on each lateral surface.

**Carapace** The width of the head is equal to 3/5 of the width of the carapace. Lateral margin of the head straight, extending back one third of the length of the carapace. Fovea distinct.

Figs. 458-461 *Cambridgea ramsayi* n.sp. Fig. 458 Ventral view of male palp. Fig. 459 Tibial processes of male palp. Fig. 460 Epigynum. Fig. 461 Internal genitalia.

**Eyes** The eyegroup occupies 2/3 of the width of the head. From above the anterior row is slightly recurved and the posterior row straight. From in front the anterior row is slightly recurved and the posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 12.18.16.17. AME separated from each other by a distance equal to 5/12 and from the ALE by 8/12 of the diameter of an AME. Lateral eyes separated by a distance equal to 9/12 of the diameter of an AME. PME separated from each other by 12/12 and from the PLE by 14/12 of the diameter of an AME. MOQ wider behind than in front in the ratio of 44.29 and longer than wide behind in the ratio of 46.44. Height of the clypeus equal to 15/12 of the diameter of an AME.

**Sternum** As long as wide. Anterior margin straight, lateral margins evenly curved. Posterior projection sharp, separating coxae 4 by 2/3 of the width of a coxa.

**Maxillae** Longer than wide in the ratio of 5.3. Inner margin convergent.

**Labium** Basal notch small. Lateral margins straight and parallel. Anterior margin gently incurved. Slightly wider than long.

**Chelicerae** Directed obliquely forward. Long and slender, equal to 5/6 of the length of the carapace. Boss present. Retromargin with two widely spaced teeth. Promargin with three closely spaced teeth at the proximal limit of the furrow.

**Palp** As shown in Figs. 458, 459.

**Legs** Spines. First leg. Femur, d.1.1.0.1. p.0.0.1.0. Tibia, v.0.2.2. p.0.1.1. r.0.0.1. Metatarsus, v.0.2.1. p.0.1.1. Second leg. Femur, d.1.1.0.1. p.0.1.1.1. Patella, d.0.1. Tibia, v.0.2.2. r.0.1.1. d.1.1.0. Metatarsus, v.0.2.1. p.r.0.1.2. Trichobothria. First leg. Tibia, 1.3. Metatarsus and tarsus, 5. Second leg. Tibia, 2.2.1. Metatarsus, 1.1.1.1.1. Tarsus, 6. Third leg. Tibia, 2.2.1.1.1. Metatarsus, 5. Tarsus, 6. Fourth leg. Tibia, 1.2.1. Metatarsus, 5. Tarsus, 6. Tarsal organ present at 4/5 of each tarsus. Superior claws with ten teeth. Inferior claw with three teeth.

**Abdomen** The posterior pair of spinnerets are slightly longer than the anterior pair. The colulus is large, flat, with the posterior margin evenly curved. No stridulating ridges.

Resembles the male in general characteristics.

**Carapace** The highest point is at the fovea and the posterior slope is steep. With the exception of the posterior slope there is a rather dense covering of long hairs.

**Palp** Trichobothria. Tibia, 3.3.2.1. Tarsus, 1.1.1.1.1. Claw with seven teeth.

**Abdomen** The median spinnerets are relatively large with the spigots extending down the posterior surface. The epigynum and internal genitalia are shown in Figs. 460, 461.

**Types** Holotype male. Taranaki. Dawson Falls, Mount Egmont, 3,100 ft, 20.i.1955, G. Ramsay. Allotype female. Taranaki, Mount Egmont, 23.iii.1969, R. R. Forster and C. L. Wilton (Otago Museum).

#### Nanocambridgea n.gen.

Medium sized (body length 5.5-7mm) ecribellate spiders with extremely long and slender legs. Carapace typical for the family with the head region distinct. Eyes in two rows, both strongly recurved when viewed from above.

Chelicerae with three teeth on the retromargin and four on promargin. Chelicerae of male longer and porrect. Lateral boss present. Trochanters not notched. Plumose hairs present. Trichobothria numerous with a double row on tibiae and a single row on metatarsi and tarsi. Superior claws strongly pectinate. Inferior claw with few teeth. Male with a stridulating organ functionally similar to that of *Cambridgea* but on the ventral surface. The plagula of the pedicel has a median longitudinal ridge and is strongly tuberculate, while the abdominal structure is a sclerotized portion of the antero-ventral surface (Fig. 394). Epigynum with a small median lobe near the posterior margin. Internal genitalia receptaculate with short ducts directed posteriorly. Cymbium of

male palp narrowing beyond the bulb and extremely long. Embolus short and spiniform. Conductor a prominent twisted plate. Median apophysis reduced and apparently immovable. Anterior and posterior spinnerets shorter than basal segment. Web similar to *Cambridgea*, usually constructed on damp banks in forest.

Type species *Nanocambridgea gracilipes* n.sp.

Related to *Cambridgea* from which it is separated by the presence of plumose hairs, the presence of four teeth on the promargin of the chelicerae and the ventral stridulating organ of the male.

Figs. 462-463 *Nanocambridgea gracilipes* n.sp. Fig. 462 Female. Fig. 463 Male.

| 3    | 4.5      | 1.0     | 3.8        | 4.5        | 1.8       | 15.6  |
| 4    | 4.9      | 1.0     | 4.8        | 5.6        | 2.4       | 18.7  |
| Palp | 4.7      | 0.8     | 3.4        |            | 3.8       | 12.7  |

*Carapace* Lightly covered with short hairs, longer in the ocular area.

**Eyes** The group occupies  $3/4$  of the width of the head. From in front the anterior row is recurved and the posterior row procurved. From above both rows rather strongly recurved. Ratio of AME:ALE:PME:PLE = 7.8:8.8. AME separated from each other and from the ALE by a distance equal to  $3/7$  of the diameter of an AME. Lateral eyes separated from each other by  $5/7$  of the diameter of an AME. PME separated from each other by  $4/7$  and from the PLE by  $6/7$  of the diameter of an AME. MOQ wider behind than in front in the ratio of 20.17 and longer than wide behind in the ratio of 26.20. Height of clypeus equal to the diameter of an AME.

**Sternum** Longer than wide in the ratio of 47:40. Embossed opposite the coxae on each side. The posterior projection separates the posterior coxae by a distance equal to half the diameter of a coxa.

*Maxillae* Longer than wide in the ratio of 33.17 and longer than the labium in the ratio of 33.15.

*Labium* As wide as long. Distal margin indented.

*Chelicerae* Promargin with four teeth and retromargin with three.

*Palp* The alveolus occupies less than 1/9 of the total length of the tarsus. The cymbium is produced distally into a long terete process. Trichobothria. Tibia, 3.3.3.2.2. Tarsus, 1.1.1. The tibial processes and the bulb are shown in Figs. 468, 469.

*Legs* Trochantera do not appear to be notched. Plumose hairs present. Spine. First leg. Femur, d,p,1.1.1. r,1.1.1.1. Patella, 0.1 (bristle). Tibia, v,0.2.1. p,1.0. r,1.1. Metatarsus, v,1.2 and distally 3, p,0. r,1. Second leg. Femur, d,p,r,1.1.1. Patella, 0.1 (bristle). Tibia, v,1.2.2. p,r,1.1. Metatarsus, v,0.2 and distally 3, p,r,1 median. Third leg. Femur, d,p,r,1.1.1. Patella, 1.1. Tibia, v,0.2.2. p,r,1.1. d,1.0. Metatarsus, same as second leg. Fourth leg. Femur, d,p,r,1.1.1. Patella, 1.1. Tibia, v,1.2.2. d,p,r,1.1. Metatarsus, v,1.1 and distally 3, p,r,1.1. Trichobothria. Tibia, p,1.1.1.1 on basal third, r,1.1.1.1 on basal half. Metatarsus and tarsus, 5. Superior claws with ten teeth and inferior claw with three teeth.

**Abdomen** There is a stridulating organ situated ventrally on the anterior part of the abdomen Fig. 394. This structure is not always visible as it can be retracted into the abdomen.

## FEMALE

Fig. 470 *Ischalea spinipes* L. Koch, immature in characteristic resting position of leaf

**Ischalea** L. Koch 1872

- 1872 *Ischalea*, Koch, L. Arachn. Austr. 1: 196.  
1877 *Podophthalma* (part), Pickard-Cambridge. Proc. Zool. Soc.: 570.  
1893 *Tetragnatha* (part), Urquhart. Trans. N. Zeal. Inst. 25: 171.  
1894 *Ischalea*, Simon. Hist. Nat. Ar. 1(3): 718, 720, 722, 723, 726.  
1898 *Ischalea*, Simon. Hist. Nat. Ar. 2(2): 283, 287, 288, 290, 193.  
1903 *Ischalea*, Simon. Hist. Nat. Ar. 2(4): 999.  
1928 *Ischalea*, Petrunkevitch. Trans. Conn. Acad. Arts. Sc. 29: 102.  
1933 *Ischalea*, Bryant. Rec. Cant. Mus. 4(1): 22.  
1946 *Ischalea*, Parrott. Rec. Cant. Mus. 5(2): 82.

Fairly large (body length 9-12mm) cribellate spiders. The elongate body form with long legs directed from and back in the resting position as in *Tetragnatha* is characteristic of this genus. Eyes in two more or less straight rows. AME smallest. Carapace flattened, with head region distinct. Chelicerae with two teeth on the retromargin and three on promargin. Legs long and slender. Spines relatively long. Trichobothria numerous, in two to three rows on tibiae and a single row

on metatarsi and tarsi. Trochanters not notched. Plumose hairs lacking. Superior claws very strongly pectinate. Inferior claw with few teeth. Anterior and posterior spinnerets almost equal in length. Distal segment of posterior spinnerets much shorter than basal segment. Colulus prominent, flattened plate, rounded posteriorly. Epigynum with a pair of small spines and paired anterior openings. Internal genitalia weakly receptaculate with ducts opening in front. Male palp long and slender. Cymbium extremely long with the bulb at the base. Embolus distal, short and spinous. Conductor stout but membranous. Median apophysis well developed, hooked.

Type species *Ischalea spinipes* L. Koch.

These spiders do not seem to construct a snare but hunt for their prey on low foliage. The colour and the pattern is variable. The colours recorded range from browns and dark yellow to leaf green. The coloration may be without any distinct pattern, particularly with green specimens, ranging to the type of pattern shown in the drawing (Fig. 475) and photograph. The spiders rest flat along a leaf or twig with the legs directed fore and aft (Fig. 470).

Although the relationship of this genus with *Cambridgea* and *Nanocambridgea* is perfectly clear, now that the group has been revised, the correct placement has been a matter of controversy in the past. L.Koch when establishing the genus from a single female considered that it was related to *Tetragnatha*. Simon in his *Histoire Naturelle des Araignées* first accepted this placing but later in the same publication transferred the genus to the Pisauridae. Subsequent authors have accepted one or other of these placings although Bryant (1933) after deciding that the genus should be placed in the Tetragnathidae did comment on the similarity of the tibial processes of the male palp to *Cambridgea*.

Close comparison of specimens from widely separate localities show little difference between populations other than colour and only a single species is recognized. The two species placed in this genus, *I. incerta* Cambr. from Madagascar, and *I. longiceps* Simon from Maurice are not related to the type species.

| 4    | 6.3      | 1.1        | 6.0 7.3 2.2             |
| Palp | 2.6      | 0.6        | 1.5 2.4 7.1             |

**Colour** The entire spider is pale straw yellow or cream with variable pattern on the abdomen but in the southern regions of the South Island the entire spider is pale green.

**Carapace** Flattened (Fig. 474). The width of the head region is slightly less than one half of the width of the thorax. The fovea is long and shallow.

**Eyes** The eyegroup occupies most of the head. Eyes pale, circled with black. Lateral eyes situated on a low tubercle which overhangs the clypeus. From above and from in front the anterior row is straight and the posterior row is slightly recurved. The ratio of the AME:ALE:PME:PLE = 8.19.12.14. AME separated from each other by a distance equal to 10/8 and from the ALE by 16/8 of the diameter of an AME. Lateral eyes separated by 5/8 of the diameter of an AME. PME separated from each other by 14/8 and from the PLE by 18/8 of the diameter of an AME. MOQ wider behind than in front in the ratio of 38.26 and wider behind than long in the ratio of 38.25. Height of clypeus equal to one half of the diameter of an AME.

**Sternum** Evenly curved from the outer margins of the labium to the posterior projection. Posterior projection short and sharp and separates coxae 4 by a distance equal to 2/5 of the width of a coxa.

**Maxillae** Twice as long as wide. Lateral margins straight and parallel.

**Labium** The basal notch is extensive. Lateral margins straight and convergent. Anterior margin straight. Longer than wide in the ratio of 13.11.

**Chelicerae** Vertical. Length equal to 3/10 of the length of the carapace. Retromargin with 2 teeth, promargin with 3 teeth.

**Palp** Long and slender. The bulb is small and the cymbium projecting beyond the bulb is slender and rounded distally (Figs. 471-473).

**Legs** Long and slender. Spines. First leg. Femur, p.1.1.1.1.1. r.1.1.1.0.1. Patella, d.1.1. Tibia, v.1.2.1.2.2.2.0. d.1 subdistal. Metatarsus, v.2.2.2.0. p.r.1.1.1.1. Second leg. Femur, p.1.1.1.1.1. r.1.1.1.1.1. d.1.0.0.0.0. Patella, d.1.1. Tibia, v.2.2.2.0. p.r.1.1.1.0. d.1.0.1.0. Metatarsus, v.2.2.2.0. p.r.1.0.1.0.0. Third leg. Femur, p.1.1.1.1.1. r.1.1.1.0.1. Tibia, v.2.2.2. p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.2.0. p.r.1.1.0.1. d.0.0.1.0. Fourth leg. Femur, p.0.1.0.1.1. r.0.1.1.1.1. Patella, d.1.1. Tibia, v.2.2.2.2. d.1.0.0.1. Metatarsus, v.2.1.1.1. p.1.1.1.1. r.1.0.0.1. The spines are long and conspicuous. Trichobothria. First leg. Tibia, 1.2.1.1.1. Metatarsus and tarsus, 4. Second leg. Tibia, 1.3.2.1.1.1. Metatarsus, 6. Tarsus, 5. Fourth leg. Tibia, 3.1.1.1.1. Metatarsus, 7. Tarsus, 6. Tarsal organ sub-distal. Inferior claw with two long teeth. Superior claws with from 27-29 long closely spaced teeth.

**Abdomen** Elongate and clothed with slender short hairs. The anterior and posterior pairs of spinnerets are subequal in length but the posterior pair are more slender. The anal tubercle is relatively large. The colulus is relatively small and sub-triangular, clothed with hairs (Fig. 476). The spiracle is small and situated immediately in front of the spinnerets.

#### Family AMPHINECTIDAE n.fam.

Eyes in two transverse rows. Cribellate and ecribellate. Median apophysis weakly sclerotized, represented by the apically hooked form and derivatives from this form. Sometimes missing. Embolus spiniform with a tendency to be twisted across the bulb, coiled or bent. Epigynum often retaining the posterior paired spines.

Internal genitalia usually with well developed convoluted ducts. Cymbium of male palp with trichobothria. Three claws, without claw tufts. Scopulae rarely present (weakly developed in *Mamoea* and *Paramamoea*). Legs strongly spined but with basic spination. Trichobothria in a double row on tibiae and a single row on the metatarsi and tarsi. Plumose hairs present or absent. Chelicerae with boss. Teeth present on both margins. Cribellum when present with two spinning fields. Colulus not divided. Calamistrum in a single row. Tracheal system simple, usually with four slender unbranched tubes originating from a median spiracle near the spinnerets and limited to the abdomen.

Fig. 479 *Amphinecta pika* n.sp. female.

Type genus *Amphinecta* Simon, 1898.

The family Amphinectidae is at present endemic to New Zealand but we have examined a number of undescribed species from Eastern Australia which belong to this family. Most of the cribellate genera construct some form of snare but these are small in relation to the size of the spiders and are rarely anything more than a limited sheet extension from a retreat.

The two common ecribellate genera *Amphinecta* and *Mamoea* would seem to be nocturnal hunters on the forest floor or, with some of the species, amongst rocks above the bushline. The eggsacs are spherical or purse-shaped, well covered with silk and guarded by the female during development. The type genus *Amphinecta* was originally described in the Agelenidae and most authors have retained this placement. It has sometimes been placed in the Argyronetidae, while Lehtinen (1967) transferred it to his Desinae (Amaurobiidae). The previously known cribellate genera *Maniho* (placed by the original author R. Marples, 1959 in the Dictynidae) and *Marplesia* Lehtinen 1967 were also placed by Lehtinen in the Desinae. The presence of a simple tracheal system in these three genera precludes their association with *Desis*. The two genera *Maniho* and *Amphinecta* which have retained an almost identical form of male and female genitalia illustrate well the limited value of the presence or absence of the cribellum and calamistrum.

#### KEY TO THE NEW ZEALAND GENERA OF THE FAMILY AMPHINECTIDAE

1. Cribellate 2
- Not cribellate 11
2. With plumose hairs 3
- Without plumose hairs 7

3. Chelicerae with two teeth on each margin and an additional row in the furrow

**Maniho** Marples

Chelicerae with two teeth on the retromargin and usually more than two on the promargin. Furrow without teeth 4

4. Small, less than 4 mm in body length. Epigynum relatively large and covering most of the epigastrium

**Dunstanina** n.gen.

Larger than above (body length 5-7 mm). Epigynum not occupying the full width of the epigastrium 5

5. Lateral eyes only slightly larger than the AME. Carapace of female with thoracic patches

**Makora** n.gen.

Lateral eyes much larger than the AME. Carapace of female without thoracic patches 6

6. Promargin of the chelicerae with three or four teeth

**Oparara** n.gen.

Promargin of the chelicerae with five teeth

**Waterea** n.gen.

7. Retromargin of chelicera with two teeth 8
- Retromargin with from 4-6 teeth

**Akatorea** n.gen.

8. Tarsal organ distal to the trichobothria. Thoracic patches not present 9
- Trichobothria extending beyond the tarsal organ. Thoracic patches present

**Rangitata** n.gen.

9. Promargin of chelicera with three teeth. Epigynum with two deep cavities

**Marplesia** n.gen.

Promargin of chelicera with more than three teeth. Epigynum without deep depressions 10

10. Small, body length, 1.5-2 mm. Promargin of chelicera with from 4-5 teeth

**Rorea** n.gen.

Medium sized to large (body length 6.5-12 mm). Promargin of chelicera with from 5-8 teeth

**Reinga** n.gen.

11. Retromargin of chelicera with two teeth 12
- Retromargin with three or more teeth 14

12. Promargin of chelicera with two teeth. Preening combs lacking 13

Promargin with from 8-9 teeth. Preening combs present on the metatarsi of legs 3 and 4

**Amphinecta** Simon

13. Tarsal organ distal to the trichobothria

**Neororea** n.gen.

Trichobothria extending beyond the tarsal organ

**Huara** n.gen.

14. Scopula present on the ventral surface of some of the segments of the legs. Promargin of chelicera with from 4-10 teeth. Embolus of male palp not coiled 15
- Scopula not present on the legs. Promargin of the chelicera with three teeth. Embolus coiled

**Holomamoea** n.gen.

15. Medium sized to large (body length 7-12 mm). Scopulae present on ventral surfaces of metatarsi and tarsi

**Mamoea** n.gen.

Medium sized to small (body length 2.5-7 mm). Scopula present only on the distoventral surface of metatarsi

**Paramamoea** n.gen.

#### *Amphinecta* Simon, 1898

- 1898 *Amphinecta*, Simon. Hist. Nat. Araign. 2: 235.  
 1917 *Amphinecta*, Dalm. Ann. Soc. Ent. Fr. 86: 397.  
 1928 *Amphinecta*, Petrunkevitch. Trans. Conn. Acad. Arts Sci. 29: 94.  
 1967 *Amphinecta*, Lehtinen. Ann. Zool. Fenn 4: 213.

Medium to large (body length 9-16mm) ecribellate spiders. Thoracic patches lacking. Eyegroup compact, occupying approximately one half of width of head. AME as large as or larger than PME. Lateral eyes distinctly larger. Two more or less straight rows. Sternum scutiform and longer than wide. Labium notched at base and as long as wide. Chelicerae with boss. Retromargin with two and promargin with eight-nine teeth. Female palp with double row of trichobothria on tibia and a single row on tarsus. Claw strongly pectinate. Legs 1423 or 4123, without plumose hairs. Trochanters notched. Preening combs present on metatarsi of legs 3 and 4. Trichobothria numerous. Double row on tibiae and a single row on metatarsi and tarsi. Superior claws

similar, strongly pectinate. Inferior claw smooth. Claw tufts and tenent hairs lacking. Colulus present as a prominent flat plate wider than long and evenly clothed with hairs. Epigynum with a pair of spines near posterior margin. Internal genitalia with pair of small receptacula from which extend thick walled ducts expanding into thin-walled and convoluted ducts. Male palp similar to *Maniho* but lacking basal retrolateral tibial process. Type species *Amphinecta decemmaculata* Simon 1898.

The structure of the male and female genitalia is very similar to *Maniho* but *Amphinecta* is ecribellate and lacks plumose hairs. It also possesses preening combs on the metatarsi of the third and fourth pairs of legs.

Lehtinen (1957) in listing the characteristics of this genus has confused the situation considerably by placing *Rubrius milvinus* Simon from Tasmania into *Amphinecta*. Through the kindness of Dr V. V. Hickman we have had the opportunity of examining both male and female specimens. This species is not related to the New Zealand forms placed in this genus and the only common characteristic is the abdominal colour pattern.

These spiders live on the forest floor and are often collected in and under rotten logs. They construct a flimsy web which appears to be more of a retreat than a snare. The eggsac, which is large and spherical, is attached within the retreat. Both males and females are readily trapped in pitfalls and so they probably are nocturnal hunters.

| Leg  | Femur    | Patella | Tibia       | Metatarsus | Tarsus     | Total |
| 1    | 4.20     | 1.60    | 3.98        | 3.18       | 2.24       | 15.20 |
| 2    | 3.20     | 1.60    | 3.19        | 3.00       | 1.88       | 12.87 |
| 3    | 2.80     | 1.20    | 2.38        | 3.00       | 1.36       | 10.74 |
| 4    | 3.60     | 1.56    | 3.42        | 4.20       | 1.88       | 14.66 |
| Palp | 2.20     | 0.80    | 1.12        |            | 2.08       | 6.20  |

**Colour** Carapace, chelicerae and sternum dark reddish brown. Legs paler reddish brown or orange brown, without bands. Abdomen shaded with grey, leaving five pairs of more or less distinct pale patches on dorsal surface.

**Carapace** Shiny with a few short hairs. Head region 14/19 of width of thorax. Lateral margins of head straight and sub-parallel, extending back distance equal to 1/5 of length of carapace. Fovea well defined.

**Eyes** Eyegroup occupies one half of width of head. From above anterior row slightly recurved and posterior row straight. From in front anterior row straight and posterior row gently procurved. AME and lateral eyes on low tubercles. Ratio of AME.ALE.PME.PLE = 21.26.19.24. AME separated from each other by 9/21 and from the ALE by 5/21 of diameter of an AME. Lateral eyes separated by 5/21. PME separated from each other by 20/21 and from PLE by 25/21. MOQ

wider behind than in front in ratio of 58.51 and wider behind than long in ratio of 58.54.

**Sternum** Scutiform. Longer than wide in ratio of 13.11. Anterior margin slightly indented. Lateral margins only gently curved back to posterior margins of coxae 3, where they slope sharply to form short posterior projection. Short sharp projections at base of each coxa. Coxae 4 separated by 2/5 of width of a coxa.

**Maxillae** Sub-parallel. Twice as long as wide. Inner margins straight but outer margins evenly curved beyond insertion of palp and merge with anterior margin. Scopula thick and consists of brown hairs.

**Labium** As long as wide. Notched at base. Lateral margins straight and strongly convergent. Anterior margin gently incurved.

**Chelicerae** Strong and vertical. Anterior surface swollen proximally. Lateral boss prominent. Retromargin with two teeth, one at distal surface of furrow and the second at proximal end. Promargin with from eight-nine teeth. A low carina extends from proximal promarginal tooth to base.

**Palp** Tibia excavated on distal retrolateral surface, with a strong spinous process on dorsal surface above excavation and heavily sclerotized plate ventrally. Five trichobothria on tibia arranged 2.2.1. Embolus in double coil. Conductor as a short white lobe with thin transparent plate. Median apophysis hooked. (Fig. 482, cf. 480).

**Legs** Scopula of short hairs on distal retrolateral surfaces of metatarsi of legs 3 and 4. Tarsal organ sub-

distal. Superior claws with eight teeth. Inferior claw with single tooth. Spines. First leg. Femur, d.0.1.1.1. Tibia, v.2.2.0. Metatarsus, v.2.2.0. Second leg. Femur, d.1.1.0.0. p.0.0.1.0. Tibia, v.2.2.0. p.0.0.1. Third leg. Femur, d.0.1.2.1. p.0.0.1.1. Tibia, v.2.2.2. p.1.1.0. r.1.1.1. Metatarsus, v.2.2.1. p.r.1.2.2. Fourth leg. Femur, d.1.1.0.0. Tibia, v.2.2.2. p.1.1.0. r.1.1.1. Metatarsus, v.2.2.2.1. p.r.1.2.0.2. Two combs on ventro-distal surface of metatarsi of legs 3 and 4. Trichobothria. Tibia, 2.2.2.1.1. Metatarsus, 1.1.1.1.1. Tarsus, 1.1.1.1.1. First four pairs of trichobothria on tibiae formed by two rows of four trichobothria situated on lateral surfaces.

**Abdomen** Closely clothed with short hairs. Anterior pair of spinnerets stouter than posterior pair but approximately equal in length. Colulus flat, rounded posteriorly and clothed with short hairs. Spiracle distinct and situated at base of spinnerets.

| Palp | 2.04     | 0.68    | 1.36  |            | 1.70   | 5.78  |

Ratio of AME.ALE.PME.PLE = 20.22.16.20. AME separated from each other by 12/20 and from ALE by 5/20 of diameter of an AME. Lateral eyes separated by 6/20. PME separated from each other and from PLE by 17/20. MOQ wider in front than behind in ratio of 52.49 and wider in front than long in ratio of 52.47. Chelicerae with two teeth on retromargin and nine teeth on promargin. Epigynum and internal genitalia as in Figs. 506, 507.

*Type* Holotype female. D'Urville Island, Mount Woore, beech forest, 23.viii.1960, I. Mannering (Otago Museum).

#### *Maniho Marples* 1959

1959 *Maniho*, Marples. Trans. Roy. Soc. N. Zeal. 87 (3, 4): 349.

1967 *Maniho*, Lehtinen. Ann. Zool. Fenn. 4: 246.

Medium sized (5-10mm body length) cribellate spiders. Carapace relatively high. Female with thoracic patches. Eyegroup occupying approximately 2/3 of width of head. Two rows, more or less straight. AME distinctly smaller than remaining eyes which are sub-equal. Sternum longer than wide with sharp posterior projection. Labium as long as wide and notched at base. Chelicerae with two teeth on each margin and a third row of five teeth on median surface along chelicerae groove. Female palp with a double row of trochobothria on tibia and single row on tarsus. Claw pectinate. Legs 1423 or 4123. Trochanters notched. Plumose hairs present. Trichobothria long and numerous. Double row on tibiae and single row on metatarsi and tarsi. No claw tufts or tenent hairs. Superior claws similar and strongly pectinate. Inferior claw strongly pectinate. Calamistrum well developed, proximal. Anterior and posterior spinnerets subequal in length. Cribellum well developed. Spinning field divided. Epigynum with small pair of spines and large anterior median opening. Internal genitalia with distinct receptacula and convoluted ducts. Male palp with characteristic coiled spiniform embolus and squat conductor (Fig. 526). Median apophysis well developed but not hooked distally.

*Type species* *Maniho tigris* Marples 1959.

These spiders are commonly found on the forest floor beneath fallen logs or under loose bark. They construct a small sheet web beneath which

| Palp         | 1.15     | 0.50       | 0.80      |            | 1.35   | 3.80  |

**Colour** Carapace pale orange brown with dark shading on upper slopes of head and thorax and narrow dark band on lateral margin of thorax. Chelicerae darker than carapace, with pale bosses. Legs same colour as

carapace with prominent dark bands. Sternum reddish brown with a dark band from median surface to posterior projection. Dorsal surface of abdomen marked as in Fig. 519. Ventral surface grey with four longitudinal rows of white spots.

**Carapace** Head region relatively high. Width of head about 5/8 of greatest width of thorax. Thoracic patches elongate, situated on lateral angle of posterior slope.

**Eyes** Group occupies 2/3 of width of head. From in front anterior row straight and posterior procurved. From above anterior row recurved and posterior straight. Ratio of AME.ALE.PME.PLE = 7.11.9.9. AME separated from each other and from ALE by 4/7 of diameter of an AME. Laterals separated by 2/7. PME separated from each other by 7/7 and from PLE by 9/7. MOQ as wide behind as long and wider behind than in front in ratio of 25.18. Height of clypeus 12/7 of diameter of an AME.

**Sternum** Longer than wide in ratio of 5.4. Lateral margin undulate. Anterior margin almost straight. Posterior projection narrow and sharp separating the posterior coxae by half diameter of a coxa.

**Maxillae** Longer than wide in ratio of 21.11 and longer than labium in ratio of 21.11.

**Labium** As wide at base as long. Notched at base. Anterior margin indented.

Figs. 519-523 Dorsal abdominal patterns of females of *Maniho*. Fig. 519 *M. tigris* Marples. Fig. 520 *M. centralis* n.sp. Fig. 521 *M. vulgaris* n.sp. Fig. 522 *M. otagoensis* n.sp. Fig. 523 *M. ngaitahu* n.sp.

**Chelicerae** Two teeth on both pro- and retromargin. Carina extends down ventral surface from proximal promarginal tooth. Five further teeth between these two rows which increase in size distally but largest smaller than marginal teeth.

**Palp** Spines. Femur, d.l.l.l. p.r.l. Patella, l.l. Tibia, p.l.2. d.l.l. r.0. Tarsus, numerous. Trichobothria. Tibia, pro-row 5, retro-row 6. Tarsus, 7 and subdistal tarsal organ.

**Legs** 1423. All trochanters notched. Plumose hairs present. Spines. First leg. Femur, prolateral spine present, d.l.l.l. p.o.l. r.l.l. Patella, 0. Tibia, v.2.2.2. p.r.l.l. d.0. Metatarsus, v.2.0 and a subwhorl of 5, p.r.l. median. Second leg. Femur, d.l.l.l. p.r.l.l. Patella, 0. Tibia, v.2.2.2. p.r.l.l. d.0.1. Metatarsus, v.2.2 and a subwhorl of 5, p.l.2. r.l.l. Third leg. Femur and metatarsus same as second leg. Patella, 0.1. Tibia, v.2.2.2. p.r.d.l.l. Fourth leg. Femur, d.l.l.l. p.l.l. r.0.1. Patella, 0.1. Tibia, v.2.1.2. p.r.d.l.l. Metatarsus, v.2.2 and subwhorl of 5, p.l.2. r.l. calamistrum 1. Trichobothria. First leg. Tibia, pro-row 5, retro-row 6. Metatarsus, 5. Tarsus, 7 and subdistal tarsal organ. Superior claws with nine teeth. Inferior claw with three teeth. Calamistrum occupies 0.35 of metatarsus.

**Abdomen** epigynum and internal genitalia as in Figs. 528, 529. Cribellum as in Fig. 524. Distal segment of posterior spinneret conical and almost as long as basal segment.

|---------|-------------|-------------|------------|
| Abdomen | length 4.10 | width 2.70  |            |
| Leg 1   | 2.50        | 1.05        | 2.35       |
| 2       | 2.25        | 1.00        | 1.85       |
| 3       | 2.15        | 0.95        | 1.70       |
| 4       | 2.65        | 1.05        | 2.40       |
| Palp    | 1.10        | 0.50        | 0.80       |

**Colour** Abdominal pattern as in Fig. 523.

**Carapace** Thoracic patch a sclerotized area with the pale fissure-like region on outer and lower part (Fig. 513).

**Eyes** Group occupies about 3/5 of width of head. From in front anterior row straight by lower margins and posterior row procurved. From above anterior row gently recurved and posterior row straight. Ratio of AME.ALE.PME.PLE = 7.9.8.9. AME separated from each other and from ALE by 5/7 of diameter of an AME. Laterals separated by 3/7. PME separated from each other and from PLE by 8/7. MOQ wider behind than in front in ratio of 24.19 and longer than wide behind in ratio of 26.24. Height of clypeus 8/7 of diameter of an AME.

**Palp** Spines. Femur, d.l.l.l. p.r.l. Patella, l.l. Tibia, d.l.l. p.l.1.1. r.0. Trichobothria. Tibia, pro-row 4, retro-row 6. Tarsus, 7 and a tarsal organ. Claw with eight teeth.

**Legs** Spines typical of genus. Trichobothria. First leg. Tibia, pro-row 5, retro-row 6. Metatarsus, 6. Tarsus, 8. Second leg and third leg. Tibia, pro-row 1.2.1.1, retro-row 5. Tarsus, 7 and a tarsal organ. Claw with eight row 4, retro-row 5. Metatarsus, 6. Tarsus, 7. Subdistal

tarsal organ. Superior claws with nine teeth and inferior claws three.

**Abdomen** Epigynum and internal genitalia as in Figs. 538, 539.

MALE

**Measurements**

|         | Carapace   | length 3.5 | width 2.2 |
|---------|------------|------------|-----------|
| Abdomen | length 3.5 | width 2.0  |           |
| Leg 1   | 2.80       | 1.05       | 2.75      |
| 2       | 2.50       | 1.05       | 2.10      |
| 3       | 2.30       | 1.00       | 1.90      |
| 4       | 3.00       | 1.10       | 2.25      |
| Palp    | 1.20       | 0.50       | 0.60      |

With the general characteristics of the female.

**Palp** Bulb and tibial processes very similar to *cantuarius*. Trichobothria. Proximal apophysis of tibia with at least one, dorsal surface with two rows, a pro-row of 2 median and a retro-row of 5. Distal trichobothria long. A further long trichobothrium near the base of spur on distal process. Tarsus, 7 and a small subdistal tarsal organ.

**Types** Holotype female, allotype male. Kaituna Valley, Banks Peninsula, 13.iv.1967, R. R. Forster, C. L. Wilton (Otago Museum).

**Records** Banks Peninsula, Canterbury. Kaituna Valley, April 1944, 10.x.1948, 11.ix.1949, 1.xi.1966, 13.iv.1967, R.R.F. Prices Valley, 14.iv.1967, R.R.F., C.L.W. Akaroa, 4.x.1949, R.R.F. | 1    | 1.35  | 0.55    | 1.15  | 1.15       | 0.80    | 5.00  |
| 2    | 1.25  | 0.50    | 0.95  | 0.90       | 0.70    | 4.30  |
| 3    | 1.15  | 0.50    | 0.85  | 0.95       | Missing |       |
| 4    | 1.45  | 0.55    | 1.25  | 1.25       | 0.65    | 4.95  |
| Palp | 0.60  | 0.25    | 0.40  |            | 0.75    | 2.00  |

**Colour** Carapace and chelicerae orange brown with eyes on black spots. Legs rather paler with dark bands. Coxae with dark shading distally. Abdomen mottled brownish grey with very little pattern discernible. There are indications of a short dark median band anteriorly and some chevrons on posterior slope. Anterior spinnerets have some dark shading.

**Carapace** Four long curved hairs on summit anterior to fovea as well as an average cover of other hairs. Radial striae well defined and a fragmented thoracic patch on each side of posterior lateral striae.

**Eyes** Group occupies about 2/3 of width of head. From in front anterior row straight and posterior row procurved. From above anterior row recurved and posterior row straight. Ratio of AME:ALE:PME:PLE = 4.6:6.6. AME separated from each other by 3/4 and from ALE by 2/4 of diameter of an AME. Laterals narrowly separated. PME separated from each other and from PLE by 5/4. MOQ wider behind than in front in ratio of 17.11 and as wide behind as long. Height of the clypeus 7/4 of diameter of an AME.

**Sternum** Scutate. Longer than wide in ratio of 35.30. Anterior margin very slightly indented to accommodate convexity of labium. Posterior projection tapers rather gently to a blunt point beyond posterior coxae which are separated by 3/4 of diameter of a coxa.

**Maxillae** Inclined towards each other. Longer than wide in ratio of 18.12 and twice length of labium.

**Labium** Wider than long in ratio of 12.9. Distal margin indented.

**Chelicerae** Promargin with two teeth and retromargin with two teeth of which basal one is much larger. Inner row of six teeth, three being much smaller.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Patella, 0.1. Tibia, p.1.1. d.0.1. r.0. Tarsus, numerous. Trichobothria. Tibia, pro 3, retro 4. Tarsus, 4. Claw with seven teeth.

**Legs** 1423. Trochanters notched. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.0.1. Patella, 0. Tibia, v.0.2.2. p.r.1.1. d.1.0. Metatarsus, v.1.2 and sub-

whorl of 5, p.r.1 median. Second leg. Femur, d.1.1.1. p.r.1.1. Patella, 0. Tibia, v.0.1.2. p.r.1.1. d.1.0. Metatarsus, same as first leg. Third leg. Femur, d.1.1.1. p.r.1.1. Patella, 0.1. Tibia, same as second leg. Metatarsus, v.0.2 and subwhorl of 5, p.1.2. r.1.1. Fourth leg. Femur, d.1.1.1. p.r.0.1. Patella, 0.1. Tibia, v.1.1.2. p.r.1.1. d.1.0. Metatarsus, v.1.2 and subwhorl of 5, p.1.1. r.1, calamistrum, 1. The calamistrum occupies 1/4 of segment. Trichobothria. Tibia, p.3. r.4. Metatarsus, 3. Tarsus, 4. Superior claw with seven teeth and inferior claw with two teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 556, 557. Spinning fields of cribellum very small and difficult to see.

With the general characteristics of female. Curved hairs present on carapace.

**Palp** Bulb and tibial processes as in Figs. 558, 559. Cymbium with 4 trichobothria.

**Types** Holotype female. Wellington. Days Bay, 2.vi.1942, R. R. Forster. Allotype male. Levin, June 1948, R. R. Forster (Dominion Museum).

#### *Akatorea* n.gen.

Medium sized (8-9.5mm in body length) cribellate spiders. Carapace of female with thoracic patches. Eye-group occupies two-thirds of width of head. Two more or less straight rows. AME and PME smaller than lateral eyes. AME usually slightly smaller than PME. Labium notched at base. Longer than wide. Sternum scutiform, as long as wide. Chelicerae with from three-four teeth on retromargin and from four-six teeth on

Fig. 560 *Akatorea gracilis* (Marples) female.

promargin. Female palp with a double row of trichobothria on tibia and a single row on tarsus. Claw strongly pectinate. Legs 4123. Plumose hairs lacking. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Superior claws strongly pectinate. Inferior claw with three teeth. Claw tufts and tenent hairs lacking. Trochantera strongly notched. Tarsal organ absent. Calamistrum proximal. Cribellum much wider than long. Spinning field divided. Anterior and posterior pairs of spinnerets equal in length. Epigynum with pair of spines, similar to *Maniho* but with paired anterior openings. Internal genitalia compact (Fig. 564). Male palp similar to *Maniho* but tibia with a basal process as well as the distal plate. Embolus distal as in *Maniho* but shorter and not coiled. Median apophysis large, hooked apically.

Type species *Maniho gracilis* Marples 1959.

Recorded only from the southern portion of the South Island. Marples (1959) found *gracilis* living in the hollow ends of rotted beech twigs but most of the specimens we have collected come from beneath and in rotten logs lying on the forest floor. They have also been found beneath loose rocks on cliff faces near the sea. They are usually associated with a small sheet web.

*Akatorea* is most closely related to *Maniho* from which it may be separated by the absence of plumose hairs, the paired membranous areas of the epigynum, the simpler form of the embolus and the hooked median apophysis.

#### *Akatorea gracilis* (Marples)

1959 *Maniho gracilis*, Marples. Trans. Roy. Soc. N. Zeal. 87(3, 4): 352.

| Total |          |                   |            | 4.73   |

**Colour** Carapace orange-yellow with dark shading around eyes and on margin of clypeus. Abdomen grey with a St. Andrews cross on mid-dorsal surface followed by two pale chevrons and a further series of thin pale transverse lines. Legs yellow brown.

**Carapace** Head region relatively high, clearly separated from thorax. Fovea long and narrow.

**Eyes** Eyes themselves small but eyegroup occupies 5/8 of width of head and from above appears to be placed on a separate lobe. From above anterior row recurved and posterior row straight. From in front anterior row slightly recurved and posterior row straight. Ratio of AME.ALE.PME.PLE = 2.4.2.3. AME separated from each other and from ALE by 3/2 of diameter of an AME. Lateral eyes subcontiguous. PME separated from each other and from PLE by 5/2. MOQ wider behind than in front and wider behind than long in ratio of 9.7. Height of clypeus twice diameter of an AME.

**Sternum** Scutiform, as wide as long. Anterior margin straight, lateral margins evenly curved. Posterior projection sharp, separating coxae 4 by half width of a coxa.

**Labium** Notched at base. Lateral margins evenly curved, anterior margin gently indented. Longer than wide at base in ratio of 7.6.

**Chelicerae** Four strong teeth on both margins. From the proximal promarginal tooth a carina extends back to base of chelicera.

**Palp** Spines. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, p.1.2. r.1.1. Tarsus many, tarsal claw with 9 short teeth. Tibia with 6 trichobothria arranged 2.2.2. Tarsus, 5.

**Legs** Spines long and strong. First leg. Femur, d.0.1.0.1.1. p.0.0.0.1.1. r.0.0.1.0. Tibia, v.2.2.2. p.1.1.1. r.0.1.1. d.0.0.1. Metatarsus, v.1.2.2. p.r.0.1.1. Second leg. | Palp    | 1.39     | 0.57    | 0.95  |            | 1.51   | 4.42  |

**Colour** Relatively pale. Carapace and legs orange-brown. Chelicerae reddish brown. Abdomen cream with five faint black bands across postero-dorsal half of abdomen.

**Carapace** Head region well developed, width equal to one half of width of thorax. Fovea distinct.

**Eyes** Eyegroup relatively compact occupying 5/9 of width of head. From above both rows appear recurved but from in front anterior row is recurved and posterior row straight. Ratio of AME.ALE.PME.PLE = 8.15.11.15. AME separated from each other by 15/8 and from ALE by 8/8 of diameter of an AME. Lateral eyes contiguous. PME separated from each other by 20/8 and from PLE by 17/8. MOQ wider behind than in front and wider behind than long in ratio of 42.31. Width of clypeus 17/8 of diameter of an AME.

**Chelicerae** Strong, equal to 4/9 of length of carapace. The number of teeth differ on the two chelicerae of holotype. One with three teeth on retromargin and 6 on promargin. The other with 4 teeth on retromargin and 5 teeth on promargin.

**Legs** Spines. First leg. Femur, d.p.0.1.1.1. r.0.1.0.1. Tibia, v.2.2.2. p.r.1.1.1. Metatarsus, v.2.2.0. p.0.1.2. r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.1.0.1. Patella, d.1.1. **Palp** Spines. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, p.1.2. d.1.1. Trichobothria. Tibia, 1.2.2.1.1. Tarsus, 7. Claw with 11 teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 548, 549. Cribellum relatively large, three times as wide as long. Spinning field small and appears divided.

**Type** Holotype female. Otago. Dunedin, under log, iv.1960, R. R. Forster. Allotype male. Leith Saddle, Dunedin, pitfall, 24.ix.1966, R. R. Forster (Otago Museum).

**Records** Waipori Gorge, 11.xii.1965, C.L.W. Matanaka Beach, on cliff face, 3.x.1968, R.R.F., C.L.W. Bull Creek, 19.v.1967, C.L.W., R. W. Hutton. Clinton, 30.ix.1959, R.R.F. Tapanui, November 1958, R.R.F.

These spiders are usually found associated with a small web beneath stones and logs on the forest floor. The Matanaka Beach specimens were found beneath loose rocks on a cliff in the spray zone.

## *Rangitata* n.gen.

Medium sized (4mm in body length) cribellate spiders. Carapace of female with thoracic patches. Eyegroup occupies about two-thirds of width of head. Two rows, more or less straight. AME distinctly smaller. Sternum scutiform, longer than wide. Labium notched at base, wider than long. Chelicerae with two teeth on retromargin and four on promargin. Female palp with a double row of trichobothria on tibia and a single row on tarsus. Tarsal organ subdistal. Claw strongly pectinate. Legs 4123, without plumose hairs. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Trichobothria present beyond tarsal organ. Superior claws similar and strongly pectinate. Inferior claw with two teeth. Calamistrum proximal. Cribellum well developed, spinning field divided. Anterior and posterior

Figs. 571-572 *Rangitata peelensis* n.sp. Fig. 571 Epigynum. Fig. 572 Internal genitalia.

spinnerets of equal length but posterior pair more slender. Epigynum similar to *Maniho*, with pair of spines. Internal genitalia with receptacula and simple convoluted ducts.

Type species *Rangitata peelensis* n.sp.

This genus, known only from a single female, is similar to *Maniho*, but lacks plumose hairs on the legs. The position of the tarsal organ behind one or more of the trichobothria is very unusual. While the epigynum is similar in appearance to *Maniho* the internal genitalia are more simple.

## *Rangitata peelensis* n.sp.

| Palp    | 0.53     | 0.23    | 0.40  |            | 0.63   | 1.79  |

**Colour** Carapace orange brown becoming darker anteriorly. Legs similar in colour but with dark bands. Abdomen pale grey with black markings as in Fig. 570.

**Carapace** Width of head 2/3 of width of thorax. Thoracic patches on lateral angles of posterior slope.

**Eyes** Group occupies 9/14 of width of head. From in front anterior row straight by upper margins and from above posterior row very slightly recurved. Ratio of AME.ALE.PME.PLE = 2.4.3.5. AME separated from each other and from ALE by 3/2 of diameter of an AME. Laterals separated by half of diameter of an AME. PME separated from each other and from PLE by twice diameter of an AME. MOQ wider behind than in front in ratio of 10.7 and wider behind than long in ratio of 10.9. Height of clypeus 7/2 of diameter of an AME.

**Sternum** Scutiform. Longer than wide in ratio of 52.44. Anterior margin almost straight. Posterior projection separates posterior coxae by 2/3 of diameter of a coxa.

**Maxillae** Inclined slightly over labium. Longer than wide in ratio of 25.15 and longer than labium in ratio of 25.13.

**Labium** Wider than long in ratio of 16.13. Notched at base.

**Chelicerae** Length 14/34 of carapace. Viewed laterally longer than wide in ratio of 14.10. Promargin of groove has four teeth, and retromargin two teeth.

**Palp** Spines. Femur, d.1.1.1. p.1 distal. Patella, d.1.1. Tibia, d.0.1. p.1.1. r.0. Tarsus with numerous spines. Trichobothria. Tibia, pro-row 1 basal, retro-row 3. Tarsus, 4 and a sub-distal tarsal organ. The claw has seven teeth.

**Legs** 4123. Hairs very sparsely ciliate. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.0.1. r.0. Tibia, v.2.2.2. p.r.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.1 median, r.0. Second leg. Femur, d.1.1.1. p.r.0.1. Tibia, v.0.1.2. p.r.0.1. Metatarsus, v.2.2 and a subwhorl of 5, p.r.1 median. Third leg. Femur, d.1.0.1. p.r.0.1. Tibia, v.2.1.2. p.r.d.1.1. Metatarsus, v.0.2 and a subwhorl of 5, p.1.2. r.0.1. Fourth leg. Femur, d.1.0.0. p.r.0.1. Tibia, v.1.1.2. p.r.d.1.1. Metatarsus, v.1.2 and a subwhorl of 5, p.1.2. r.1 calamistrum 1. Trichobothria. First leg. Tibia, pro-row 2 basal, retro-row 3 extending to the midpoint. Metatarsus, 1 median, 1 subdistal. Tarsus, 4. Tarsal organ between third and fourth trichobothria at a point 2/3 of length of tarsus from base. Tarsus of the second leg has 4 trichobothria with tarsal organ much nearer base (9/12), between second and third trichobothria. Tarsi of third and fourth legs have 3 trichobothria with tarsal organ on third leg situated just beyond first trichobothria and on fourth leg just in front of first trichobothria at a point on both legs 1/3 of length of tarsus from base. Superior claws of first leg with ten teeth and inferior claw two teeth. Seven teeth on superior claws of fourth leg. Calamistrum occupies 26/85 of metatarsus.

**Abdomen** Epigynum and internal genitalia as in Figs. 571-572. Cribellum divided, posterior margin strongly sclerotized and wider than long in ratio of 15.5. Width of cribellum is 15/23 of width of anterior spinnerets. Anterior spinnerets separated by 3/10 of diameter of an anterior spinneret. Posterior spinnerets less than half diameter of an anterior spinneret and about same length. Distal segment conical.

**Type** Holotype female. Canterbury. Peel Forest, 30.ix.1966, R. R. Forster, C. L. Wilton (Otago Museum).

## *Oparara* n.gen.

Medium sized (6-7mm in body length) cribellate spiders. Thoracic patches absent. Eyegroup compact, occupying little more than half of width of head. AME smallest. Remaining eyes subequal. Two more or less straight rows. Sternum scutiform, as long as wide. Labium notched at base as long as or longer than wide. Chelicerae with boss. Retromargin with two and promargin with from three-four teeth. Legs 4123. Plumose hairs present. Trochanters notched. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Tarsal organ subdistal. Superior claws similar, strongly pectinate. Inferior claw with three teeth. Calamistrum well developed in female, weak in male, proximal. Claw tufts and tenent hairs lacking. Female palp with double row of trichobothria on tibia and single row on tarsus. Claw strongly pectinate. Epigynum with

Fig. 573 *Oparara valla* (Marples) female.

paired spines. Anterior opening divided. Internal genitalia with pair of receptacula and flattened, convoluted ducts. Tibia of male palp with basal retrolateral process as well as distal processes. Embolus originates from mid-ventral surface extending directly forward and twisted distally. There appears to be a membranous conductor fused to embolus. Median apophysis well developed as a concave lobe (Fig. 575). There is a small tegular apophysis on mid prolateral margin.

Type species *Ixenticus vallus* Marples 1959.

The two species recorded below are found in the north-west of the South Island. The genitalia suggest that *Oparara* is most closely related to *Akatorea* which has the divided anterior opening of the epigynum and similar tibial processes. The detailed structure of the bulb is very similar to the cribellate *Aorangia*. There is a small lobe on the mid prolateral surface which could be a homologue of the prominent plate characteristic of *Aorangia*.

| Palp | 0.72     | 0.36    | 0.48  |            | 0.90   | 2.46  |

**Colour** (Fig. 573). Cephalothorax orange brown with black shading on lateral margins of thoracic region. Legs reddish brown with faint blackish shading forming inconspicuous bands. Abdomen dark.

**Eyes** Eyegroup relatively compact and occupies 9/14 of width of head. From above and in front posterior row appears procurved and anterior row gently recurved. Ratio of AME.ALE.PME.PLE = 6.10.9.10. AME separated from each other and from ALE by 5/6 of diameter of an AME. Lateral eyes contiguous. PME separated from each other by 9/6 and from PLE by 7/6. MOQ wider behind than in front in ratio of 27.17 and wider behind than long in ratio of 27.25. Height of clypeus 15/6 of diameter of an AME.

**Sternum** Scutiform, as long as wide. Posterior projection sharp separating coxae 4 by 2/3 of diameter of a coxa.

**Maxillae** Outer margin curves in distally. Anterior margin oblique. Twice as long as wide at base.

**Labium** Notched at base. Lateral margins straight but converging. Anterior margin gently indented. As long as wide at base.

**Chelicerae** Retromargin with two, promargin with three teeth of which median is largest. Carina present on ventral surface behind promarginal teeth.

**Palp** Spines. Femur, d.0.1.1.2. Tibia, d.2.1. Tarsus, v.1.1.2.2. p.r.2.1.0.0. d.1.0.0.0. Claw almost straight, with eight short teeth. Trichobothria, tibia, 1.2.2.1. Tarsus, 4.

**Legs** 1423. Spines. First leg. Femur, d.1.0.1.0. p.0.0.1.1. Tibia, v.2.2.2. p.r.0.1.1. Metatarsus, v.2.2.2. p.r.0.1.1. Second leg. Femur, d.1.0.1.1. p.1.0.1. Tibia, v.2.2.2. p.r.0.1.1. d.0.0.1. | Palp | 1.20     | 0.50    | 0.82  |            | 1.32   | 3.84  |

**Colour** Carapace, legs and chelicerae dark reddish brown. Abdomen strongly mottled with greyish brown.

**Carapace** Head broad, half as wide as thoracic region. Lateral margins of head region straight and parallel, extending 3/8 of length of carapace. Fovea distinct with surface on each outer margin slightly raised.

**Eyes** Eyegroup occupies 4/7 of width of head. From above both rows are straight but from in front anterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 10.17.12.17. AME separated from each other by 10/10 and from ALE by 8/10 of diameter of an AME. Lateral eyes contiguous. PME separated from each other by 18/10 and from PLE by 15/10. MOQ wider behind than in front in ratio of 42.30 and wider behind than long in ratio of 42.37. Width of clypeus slightly more than twice diameter of an AME.

**Chelicerae** Lateral boss small, length 3/8 of carapace. Retromargin with two teeth, promargin with four teeth of which second tooth from base is largest.

**Abdomen** Epigynum as in Fig. 579. Spinous processes small. Internal genitalia complex (Figs. 580, 581) consisting of single pair of large vesicles from which extends a pair of convoluted ducts which before opening externally are flattened and twisted. Cribellum small, divided and deeply notched on posterior margin.

**Legs** Spines. First leg. Femur, d.p.1.0.1.1. Tibia, v.1.2.2. p.r.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. d.1.0.1. Second leg. Femur, d.p.1.0.1.1. Tibia, v.1.2.1. p.r.0.1.1. d.0.0.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. d.0.1.0. Trichobothria. First leg. Tibia, 1.1. Metatarsus, 3. Tarsus, 5. Other legs. Tibia, 2.1.1.1. Metatarsus, 5. Tarsus, 6. Metatarsi and tarsi very slender. Calamistrum well developed, occupying median third of metatarsus 4. Inferior claw with three long teeth. Superior claws with from 9-10 teeth.

**Palp** Spines. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, p.1.1. d.1.0. Claw with 9 teeth. Trichobothria. Tibia, 3.1.1.1.1, tarsus, 7.

**Type** Holotype female. Nelson. Karamea, South Terrace, 20.i.1950, R. R. Forster (Otago Museum).

**Record** Nelson. Oparara, 28.ix.1966, R.R.F., C.L.W.

#### *Dunstanian* n.gen.

Small (2.5-4mm in body length) cribellate spiders. Carapace with thoracic patches in female. Eyegroup occupying approximately two-thirds of width of head. Two rows, more or less straight. AME little more than half of diameter of remaining eyes. Sternum scutiform,

579

580

581

Figs. 579-581 *Oparara karamea* n.sp. Fig. 579 Epigynum. Fig. 580 Internal genitalia, dorsal view. Fig. 581 Internal genitalia, ventral view.

Fig. 582 *Dunstania kochi* n.sp. female.

longer than wide. Both pro- and retromargins of chelicerae with from two-three teeth. Female palp usually with a double row of trichobothria on tibia and a single row on tarsus although tarsal trichobothria are not recorded for some species. Legs 4123, with plumose hairs. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Superior claws strongly pectinate; inferior claw with two teeth. Claw tufts and tenent hairs absent. Tarsal organ often absent. Trochanters weakly notched. Anterior and posterior pairs of spinnerets equal in length. Cribellum distinct, spinning fields divided. Epigynum very large with a median oval or sub-rectangular area delineated by a marginal overhanging lip. Spines lacking. Internal genitalia as in Fig. 589. Male known only from the type species. Embolus originates from retromargin, curving back and under the bulb where it is notched before extending to conductor. Conductor a massive concave plate. Median apophysis well developed, membranous and not hooked distally (Fig. 586).

Type species *Dunstania hesperis* n.sp.

These small cribellate spiders are found on the forest floor, under bark or in leafbases of shrubs and trees. They construct a small shapeless web. Two species described by Marples (1959) and placed in *Ixeuticus* (*nuntia*, *angustiae*) are transferred below to *Dunstania*. The genus ranges over practically all of New Zealand except for the far north.

*Dunstania* is undoubtedly closely related to *Makora* but the form of the epigynum is very distinctive.

**Colour** Carapace very pale cream with slight stippled shading anteriorly. Eyes on black patches. Legs without dark bands. Sternum pale, stippled with black. Maxillae and labium pale orange brown. There is a conspicuous pale area medially on anterior half of dorsal surface of abdomen. Lateral slopes densely flecked with black, posterior slope black with a series of four or five pale inconspicuous chevrons. Ventral surface separated from lateral surfaces by a pale band on each side with a series of four pairs of pale spots mesially.

**Carapace** Thoracic patches small. Width of the head 5/7 of thorax.

each PME on a black spot pointed fore and aft. Chelicerae of same shade as head but bosses paler. Legs pale yellow, without bands. Sternum shaded black with the dark posterior pointed sector conspicuous because of a pale margin. Median anterior region of abdomen with a pale area indented laterally, followed by six pale chevrons which decrease in size posteriorly. Ventral surface of the abdomen has three pairs of pale spots bounded on each side by a pale band. Anterior spinnerets black and posterior pair pale.

**Carapace** Thoracic patches as in Fig. 515, and profile as in Fig. 511.

**Eyes** Relatively large. The group occupies 3/4 of width of head. From in front anterior row procurved by lower margins and from above the posterior row is procurved. Ratio of AME.ALE.PME.PLE = 4.6.6.6. AME separated from each other and from ALE by a distance equal to 3/4 of diameter of an AME. Laterals narrowly separated. PME separated from each other and from PLE by 5/4 of diameter of an AME. MOQ wider behind than in front in ratio of 17.11 and longer than wide behind in ratio of 18.17. Height of clypeus 5/4 of diameter of an AME.

**Chelicerae** Promargin with three teeth and retromargin with two of which basal tooth is larger.

**Palp** Spines. Femur, d.1.1.1. p.r.0. Patella, 1.1. Tibia, d.0.1. p.1.1. r.0. Trichobothria. Tibia, pro 3, retro 2. Tarsus, 1.1.1 and a tarsal organ. Claw with nine teeth.

**Legs** Spines dark and fairly stout. First leg. Femur, prolateral spine present, d.1.1.1. p.r.0.1. Patella, 1.1. Tibia, v.0.2.2. p.1.1. r.0.1. d.1.0. Metatarsus, v.2.2 and subwhorl of 5, p.r.1.0. Second leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. Tibia, v.0.2.2. p.r.1.1. d.1.0. Metatarsus, v.2.2 and subwhorl of 5, p.r.d.1.0. Calamistrum occupies about 1/3 of length of segment. Trichobothria. First leg. Tibia, p.3, r.4. Metatarsus and tarsus, 3. Superior claws with nine teeth and inferior with two.

**Abdomen** Epigynum and internal genitalia as in Figs. 594, 595. Cribellum as in Fig. 585. Distal segment of posterior spinnerets conical and about half as long as basal segment.

**Types** Holotype female. Taranaki. Dawson Falls, Mt Egmont, 22.ii.1967, C. L. Wilton (Otago Museum). Paratype female, same data.

#### Measurements

|      | Carapace | length  | width |            |        |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | width |            |        |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 1.20     | 0.48    | 1.08  | 0.96       | 0.60   | 4.32  |
| 2    | 1.14     | 0.48    | 0.84  | 0.90       | 0.60   | 3.96  |
| 3    | 1.08     | 0.48    | 0.78  | 0.90       | 0.60   | 3.84  |
| 4    | 1.26     | 0.48    | 0.96  | 1.14       | 0.54   | 4.38  |
| Palp | 0.54     | 0.30    | 0.36  |            | 0.60   | 1.80  |

**Colour** Cephalothorax yellow brown with dark shading around thoracic groove and on lateral surfaces of head. Eyes surrounded with black. Legs yellowish with pale brown bands. Abdomen grey with few dark markings, which leave a large pale patch on antero-medial dorsal surface followed by three pale chevrons.

**Eyes** Eyegroup wide, occupying 5/6 of width of head. From above anterior row slightly recurved and posterior row procurved. From in front anterior row straight and posterior row procurved. Ratio of AME.ALE.PME.PLE = 5.10.8.10. AME separated from each other by 5/5 and from ALE by 4/5 of diameter of an AME. Laterals

contiguous. PME separated from each other and from PLE by 7/5 of diameter of an AME. MOQ wider behind than in front in ratio of 23.15 and wider behind than long in ratio 23.21. Height of clypeus equal to diameter of an AME.

**Chelicerae** Retromargin with two teeth, promargin with three of which median is largest. Carina extends from basal promarginal tooth to base of chelicera.

**Palp** All of segments with bristles.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.0.2.2. p.0.1.1. d.0.1.0. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.0.1.2. p.0.1.1. Metatarsus, v.2.2.1. p.0.1.1. r.0.1.2. Trichobothria. First leg. Tibia, 1.1. Metatarsus, 4. Tarsus, 3. Other legs, Tibia, 2.1.1. Metatarsus and tarsus, 3. Superior claws of legs 1 and 2 with 11 teeth, of legs 3 and 4 with six. Inferior claw with two teeth.

**Abdomen** Epigynum large, similar to *nuntia* but median opening broader and anterior ridge much wider (Fig. 596). Internal genitalia as in Fig. 597. Cribellum large and divided.

**Type** Holotype female. Canterbury. Arthurs Pass, iv.1953, R. R. Forster (Otago Museum).

**Colour** Carapace and appendages pale yellow brown. Abdomen grey with from six-seven indistinct blackish chevrons down dorsal surface of which anterior three are broken mesially.

**Eyes** Eyegroup occupies 7/10 of width of head. From above anterior row straight and posterior row slightly procurved. From in front anterior row straight and posterior strongly procurved. Ratio of AME.ALE.PME.PLE = 3.8.6.7. AME separated from each other and from ALE by 2/3 of diameter of an AME. Laterals contiguous. MOQ wider behind than in front in ratio of 16.8 and wider behind than long in ratio of 16.15. Height of clypeus twice diameter of an AME.

**Chelicerae** Boss extends down chelicera as a ridge for one quarter of its length. Retromargin with two and promargin with three teeth.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.1.2. d.0.1. Tarsus many. Tibia with five trichobothria arranged 2.2.1. Claw with eight small teeth.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.0.0.1. p.1.0.0. Metatarsus, v.0.2.1. p.r.0.0.2. Second leg.

Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.p.0.0.1. Metatarsus, v.0.1.1. p.0.1.2. r.0.0.2. Trichobothria. First leg. Tibia, 2.2.1. Metatarsus, 1. Tarsus, 3. Other legs, Tibia, 1.1.2. Metatarsus, 2. Tarsus, 3. Superior claws with nine teeth on legs 1 and 2, and six on legs 3 and 4. Inferior claw with single tooth.

**Abdomen** Cribellum rather narrow and divided. Epigynum large (Fig. 602) and internal genitalia as in Fig. 603.

**Type** Holotype female. Taranaki. Englewood, from forest, 28.viii.1960, B. J. Marples (Otago Museum).

#### *Dunstanira mira* n.sp.

Figs. 600-601

Marples (1959) examined the specimen which now becomes the type of this species and doubtfully concluded that it should be placed with his species *Ixeuticus nuntius* Marples, described from Westland. Further examination of the specimen shows that it is quite distinct from this species and is a North Island representative of the *nuntia-angustiae* group. The general characteristics are as listed for *Dunstanira nuntia* (Marples).

**Eyes** From above both rows appear straight. From in front posterior row slightly procurved and anterior row straight. Ratio of AME.ALE.PME.PLE = 5.10.9.7. AME separated from each other and from ALE by a diameter of an AME. Laterals contiguous. PME separated from each other by 8/5 and from PLE by 5/5. MOQ wider behind than in front in ratio of 26.15 and wider behind than long in ratio of 26.24. Height of clypeus 3/5 of diameter of an AME.

**Chelicerae** Both pro- and retromargins with two teeth.

**Abdomen** Epigynum and internal genitalia are shown in Figs. 600, 601.

**Type** Holotype female. Manawatu. Vinegar Hill Reserve, xii.1948, R. R. Forster (Otago Museum).

| Palp | 0.35     | 0.20    | 0.25  |            | 0.40   | 1.20  |

**Colour** (Fig. 582). Carapace very pale and only slightly shaded anteriorly. Eyes on black spots. Legs pale without bands. Sternum with uniform dark olive shading. Abdomen dark with very faint indications of cross and chevron pattern. Ventral surface shows faintly three pairs of pale spots bordered on each side with a row of pale spots. Anterior spinnerets although shaded not as dark as surrounding area.

**Carapace** Thoracic patches very small.

**Eyes** Group occupies 2/3 of width of head. From in front anterior row straight and posterior row procurved. From above anterior row recurved and posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 3.5.4.5. AME separated from each other and from ALE by 2/3 of diameter of an AME. Laterals

narrowly separated. PME separated from each other and from PLE by diameter of an AME.

**Chelicerae** Both margins with three teeth.

**Palp** Spines. Femur, d.1.1.1. p.r.0. Patella, 1.1. Tibia, d.1.1. p.1.2. r.0. Tarsal organ present.

**Legs** Hairs plumose. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.0.1. r.0. Patella, 0.1. Tibia, v.0.0.2. p.1.1. r.0. d.1.0. Metatarsus, v.0.2 and subwhorl of 5, p.r.0. Second leg. Femur, d.1.1.1. p.r.0.1. Patella, 0.1. Tibia, as first leg. Metatarsus, v.0.2 and subwhorl of 5, p.1. r.0.

**Abdomen** Epigynum and internal genitalia as in Figs. 604, 605.

**Type** Holotype female. Otago. Near Dunstan Downs Stn, between Omarama and Lindis Pass, under stone, 26.vii.1967, R. R. Forster (Otago Museum).

#### *Makora* n.gen.

Medium sized (5-7mm in body length) cribellate spiders. Carapace of female with thoracic patches. Eye-group occupies approximately two-thirds of width of head. Two rows with anterior row straight and posterior row gently procurved. Eyes sub-equal with AME always slightly smaller. Sternum longer than wide. Labium wider than long and notched at base. Chelicerae with two teeth along retromargin and from two-three on promargin. Palp with trichobothria in a double row on tibia but none on tarsus. Claw strongly pectinate. Legs 1423. Trochanters notched. Plumose hairs present. Trichobothria in a double row on tibiae and a single row on metatarsi and tarsi. Tarsal organ subdistal. Superior claws similar and strongly pectinate. Inferior claw with two teeth. No claw tufts or tenent hairs. Calamistrum well developed, proximal. Cribellum well developed, spinning fields divided. Anterior and posterior

Fig. 606 *Makora mimica* n.sp. female.

Fig. 607-610 *Makora figurata* n.sp. Fig. 607 Retrolateral view of male palp. Fig. 608 Ventral view of male palp. Fig. 609 Epigynum. Fig. 610 Internal genitalia.

pairs of spinnerets of equal length. Genitalia as in Fig. 609 with surface finely grooved in whorls and a median anterior opening. The embolus originates from the mid retrolateral surface of bulb and is sharply bent. Conductor a large concave structure. Median apophysis in form of a large thin plate (Fig. 608).

Type species *Makora figurata* n.sp.

The species described by Marples (1959) as *Ixeuticus calypso* is placed in this genus. Both male and female were described but the male specimen was apparently lost before the paper was published. It is presumed that the specimen described and figured by Marples came from Central Otago. The figures of the palp show many similarities to *figurata* in the shape of the tibial processes and the position of the structures of the bulb. Unfortunately lack of an illustration of the ventral aspect does not permit any close comparisons.

*Makora* is most closely related to *Dunstanina* from which it is readily separated by the form of the epigynum and internal genitalia.

|      |          | length 3.50 | width 2.50 |            |        |       |
| Leg  | Femur    | Patella     | Tibia      | Metatarsus | Tarsus | Total |
| 1    | 1.95     | 0.90        | 1.70       | 1.70       | 0.90   | 7.15  |
| 2    | 1.90     | 0.90        | 1.45       | 1.50       | 0.75   | 6.50  |
| 3    | 1.80     | 0.80        | 1.25       | 1.40       | 0.70   | 5.95  |
| 4    | 2.10     | 0.95        | 1.55       | 1.70       | 0.75   | 7.05  |
| Palp | 0.80     | 0.40        | 0.60       |            | 0.90   | 2.70  |

**Colour** Carapace orange brown and although radial striae and head are darker there is little difference in colour. Chelicerae glossy brown, darker than carapace with boss paler. Legs similar to carapace and without bands. Sternum pale brown, darker at margins. Maxillae and labium bright brown becoming white distally. Abdomen pale on antero-median surface followed by two pale chevrons, otherwise upper surface brownish grey darkening on lower slopes. Ventral surface grey, separated from lateral surfaces on each side by a band of contiguous pale spots. Between epigastric furrow and spinnerets there are four pairs of pale spots.

**Carapace** Head 3/4 of greatest width of carapace. Covering of shorter hairs extends on to lateral slopes especially on slight ridges between striae.

**Eyes** Group occupies 7/9 of width of head. From in front anterior row slightly procurved and from above posterior row more strongly procurved. Ratio of AME.ALE.PME.PLE = 7.8.8.8. AME separated from each other and from ALE by distance equal to diameter of an AME. Laterals separated by 3/7. PME separated from each other by 10/7 and from PLE by 11/7 of diameter of an AME. MOQ wider behind than in front in ratio of 26.21 and longer than wide behind in ratio of 27.26. Height of clypeus equal to diameter of an AME.

**Sternum** Scutiform. Longer than wide in ratio of 18.13. Anterior margin concave with posterior projection separating posterior coxae by 2/5 of diameter of a coxa.

**Maxillae** Longer than wide in ratio of 5.3. and twice as long as the labium. Inclined slightly over labium.

**Labium** Wider at base than long in ratio of 28.25. Slight notches at base and distal margin slightly emarginate.

**Chelicerae** Viewed laterally longer than wide in ratio of 21.20. Three teeth on promargin and two on retro-marginal.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.1.1. p.1 basal and 1.1 distal. r.0. A number of spines on tarsus. Trichobothria. Tibia, pro-row 3, retro-row 4. Eight or nine teeth on the claw.

**Legs** 1423. The short adpressed hairs are strongly ciliate or plumose. Spines moderately long and strong and obtusely pointed. Spines. First leg. Femur, prolateral spine is present, d.1.1.1. p.r.0.1. Patella, 1.1, short bristles. Tibia, v.1.2.2. p.1.1.1. r.1.1.0. d.1 (short bristle). Metatarsus, v.2.2 and a subwhorl of 5, p.1. r.1. Second leg. Femur, d.1.1.1. p.r.1.1. Patella, d.1.1 (bristle). Metatarsus, v.2.2 and a subwhorl of 5, p.1.2. r.0.1. Third leg. Femur, d.1.1.1. p.1.1. r.0.1. Patella, d.1.1. Tibia, v.0.2.2. p.r.d.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.1.2. r.1.1. Fourth leg. Femur, d.1.1.1. p.r.0.1. Patella, d.1.1. Tibia, v.1.1.1. p.r.d.1.1. Metatarsus, v.1.2 and a subwhorl of 5, p.1.1. r.1 calamistrum 1. Trichobothria. First leg. Tibia, pro-row 4 on the basal quarter, retro-row 5 reaching to mid-point. Metatarsus, 4. Tarsus, 5. Fourth leg. Tibia, pro-row 1.2.1.1. Retro-row 5. Metatarsus, 5. Tarsus, 5. Tarsal organ distal to trichobothria. Nine teeth on the superior claw of first leg and seven on fourth leg. Interior claw with two teeth. Calamistrum occupies 0.45 of length of metatarsus.

**Abdomen** Epigynum and internal genitalia as in Figs. 609, 610. Cribellum divided, six times as wide as long, 6/7 of width of anterior spinnerets. Anterior spinnerets separated by 1/5 of diameter of an anterior spinneret.

**Colour** Cephalothorax reddish brown, darker on the head. Eyes ringed with black. Legs reddish brown. Abdomen grey.

**Eyes** Eyes large. The eyegroup occupies 2/3 of width of head. From above anterior row straight and posterior row slightly procurved. Ratio of AME.ALE.PME.PLE

= 11.12.12.11. AME separated from each other by 9/11 and from ALE by 6/11 of diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 13/11 and from PLE by 12/11. MOQ wider behind than in front in ratio of 37.31 and wider behind than long in ratio of 37.33. Height of clypeus 8/11 of diameter of an AME.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, d.1.0.0. p.1.0.2. Tarsus, v.0.1.1.0.1. p.2.1.2.1. r.1.0.0.1.0. Tarsal claw with eight teeth.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Tibia, v.0.2.2. p.1.1.1. r.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Tibia, v.0.2.2. p.r.0.1.1. Metatarsus, v.2.2.1. p.r.1.1.1. d.1.1.2. Trichobothria. First leg. Tibia, 2.2.2.1. Metatarsus, 4. Tarsus, 3. Fourth leg. Tibia, 2.2.2.1. Metatarsus, 2. Tarsus, 4. Calamistrum extends over a little more than one half of metatarsus. Superior claws with eight, inferior with two teeth.

**Abdomen** Epigynum large (Figs. 611, 613). Internal genitalia simple, consisting of pair of globular vesicles and pair of simple tubes which open anteriorly (Figs. 612, 614).

MALE

Marples (1959) gives a description of a single male specimen but this specimen has been lost. The general

characters appear to be the same as in the female. The cribellum and calamistrum are not functional. The measurements given by Marples are as follows:

#### Measurements

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 1.40  | 0.60    | 1.20  | 1.15       | 0.70   | 5.05  |
| 2    | 1.30  | 0.60    | 0.95  | 1.00       | 0.55   | 4.40  |
| 3    | 1.15  | 0.60    | 0.80  | 0.90       | 0.50   | 3.95  |
| 4    | 1.40  | 0.60    | 1.00  | 1.10       | 0.55   | 4.65  |
| Palp | 0.55  | 0.25    | 0.40  |            | 0.55   | 1.75  |

**Colour** carapace pale orange brown with scattered dark shading which becomes more obvious anteriorly. Chelicerae slightly darker with shading on mid anterior surface. Legs pale yellowish orange without bands. Sternum shaded dark but densely spattered with pale spots. Maxillae yellowish orange. Labium much darker. The abdomen has an ill-defined pale cross anteriorly. Lateral and posterior slopes quite dark. Ventral surface patterned as in *figurata*.

**Eyes** Group occupies 5/7 of width of head. From in front anterior row slightly procurved and posterior row procurved. From above anterior row very slightly recurved and posterior row procurved but not as much as *diversa*. Ratio of AME.ALE.PME.PLE = 5.7.6.7. AME separated from each other by a distance equal to, and from ALE by 4/5 of the diameter of an AME. Laterals narrowly separated. PME separated from each other by 7/5 and from PLE by 9/5. MOQ wider behind than in front in ratio of 19.15 and longer than wide behind in ratio of 20.19. Height of clypeus equal to diameter of an AME.

**Sternum** Longer than wide in ratio of 50.39. Posterior coxae separated by slightly more than 1/3 of diameter of a coxa.

**Maxillae** Longer than wide in ratio of 5.3 and twice length of labium.

**Labium** Wider than long in ratio of 5.4. Distal margin rounded.

**Chelicerae, palp and legs** Typical.

**Abdomen** Epigynum and internal genitalia as in Figs. 615, 616.

**Type** Holotype female. Canterbury. Kaituna Valley, Banks Peninsula, 13.iv.1967, R. R. Forster, C. L. Wilton (Otago Museum). Paratype female, same data.

#### **Makora minica n.sp.**

**Colour** Carapace and chelicerae orange brown. Legs paler and without bands. Sternum pale yellowish brown with a very narrow dark marginal band. Abdomen brownish grey with only a slight trace of pattern.

**Eyes** Group occupies 2/3 of width of head. From in front anterior row straight and posterior row procurved. From above anterior row slightly recurved and posterior row moderately procurved. Ratio of AME.ALE.PME.PLE = 6.8.7.8. AME separated from each other and from ALE by diameter of an AME. Laterals narrowly separated. PME separated from each other by 8/6 and from the PLE by 12/6. MOQ wider behind than in front in ratio of 22.18 and longer than wide behind in ratio of 23.22. Height of clypeus equal to diameter of an AME.

**Chelicerae** Geniculate. Promargin with carina and three teeth and retromargin with two teeth. Basal tooth as large as median tooth of promargin.

**Legs** 1423. Trochanters slightly notched. Addressed hairs plumose and a thick covering of upstanding ciliate hairs. Spination similar to *figurata*.

**Abdomen** Epigynum and internal genitalia as in Figs. 619, 620.

**Type** Holotype female. Canterbury. Ribbonwood Creek, Cass, May 1954, R. R. Forster (Canterbury Museum). Paratypes. Two females from same locality and date.

**Records** Canterbury. Otarama, 17-20.x.1921, G. Archey. Bealey Hotel, 4.xii.1955, B. J. Marples. Lake Ohau, May 1958,

#### **Marplesia Lehtinen 1967**

1967 *Marplesia*, Lehtinen. Ann. Zool. Fenn. 4: 246.

Medium sized (5.5-6mm in body length) cribellate spiders. Thoracic patches absent. Eyes relatively large and occupy most of width of head. Anterior row straight, posterior row slightly procurved. Eyes subequal with AME smallest. Sternum scutiform, longer than wide. Labium wider than long and notched at base. Chelicerae with two teeth on retromargin and three on promargin. Female palp with a double row of trichobothria on tibia but none on tarsus. Claw strongly pectinate. Legs 1423. Trochanters not notched. Plumose hairs lacking. Trichobothria in a double row on tibiae and a single row on metatarsi and tarsi. Superior claws similar, strongly pectinate. Inferior claw with two teeth. Tarsal organ subdistal. Claw tufts and tenent hairs lacking. Cribellum much wider than long. Spinning field divided. Anterior and posterior pairs of spinnerets of equal length but posterior pair more slender. Epigynum strongly sclerotized, with a pair of deep cavities anteriorly. Spines absent. Internal genitalia with paired receptacula and wide flattened ducts. Embolus originating from the mid retromargin and directed beneath the bulb anteriorly where the embolus is bent. Conductor present as a membranous sheath attached to basal half of embolus. Median apophysis absent but there is a prominent pro-lateral process.

Type species *Marplesia dugdalei* n.sp.

Fig. 621 *Marplesia dugdalei* n.sp. female.

The history of this genus is complicated by the fact that it was erected by Lehtinen for the species described by Marples (1959) as *Ixeuticus janus* Bryant. *I. janus* Bryant is however a typical species of *Neoramia* and is redescribed in the present paper. The species described by Marples is recorded below as *Marplesia dugdalei* n.sp. and as Lehtinen's genus was based on the characteristics of this species the generic name is retained.

While undoubtedly a typical member of the *Maniho* series of genera, *Marplesia* is not directly related to any of the genera recorded below. Both species have been found on overhanging rock in shady and damp situations. Marples gives the following description of the webs and eggsacs of *M. dugdalei* and Wilton noted a similar structure for *M. pohara*.

The web is a mushroom shaped structure similar to that of *Amarara fera* (= *Stiphidium facetum* Simon) with a smaller retreat below a large flat web. The upper sheet is continuous and much thicker and denser. The retreat ceiling is a small sheet guyed to the substrate. A major contrast is shown in the position of the spider which sits on the lower sheet, head down, rather than on the cliff face or of the cocoons which are

incorporated in the tangle which fills in the space between the two sheets. The upper large sheet is continuous and guyed at the scalloped margins by the short guy threads. The retreat sheet is supported from the main web by the funnel shaped depression which is completely closed over by secondary layers. These secondary layers seem to be added as the web requires to grow larger and give the upper sheet its continuous appearance.

The average diameter of 20 webs is 53 mm with a range from 13 mm to 110 mm and has an average of 14 guy threads around the sheet with a range from 10-19. The cocoon is about 1 cm in diameter and is biconvex to planoconvex in shape. It is made of thin white silk covering containing some debris, and is suspended below or affixed to the upper sheet.

| 3    | 2.16  | 0.78    | 1.56  | 1.92       | 0.84   | 6.76  |
| 4    | 2.34  | 0.84    | 1.98  | 2.16       | 1.02   | 8.34  |
| Palp | 0.84  | 0.36    | 0.60  |            | 0.90   | 2.70  |

**Colour** (Fig. 621). Carapace pale straw yellow, darkening to reddish brown on head and median surface of thoracic region. Abdomen uniform grey.

**Carapace** Numerous short hairs on both head and thorax and a series of longer hairs down median surface of head.

**Eyes** Eyes large and occupy 7/8 of width of head. From above anterior row straight and posterior row slightly procurved. From in front anterior row slightly recurved. Ratio of AME:ALE:PME:PLE = 10.14.11.14. AME separated from each other by 6/10 and from ALE by 5/10 of diameter of an AME. Lateral eyes sub-contiguous. PME separated from each other by 10/10 and from PLE by 11/10. MOQ wider behind than in front in ratio of 15.13 and as long as wide behind; Clypeus narrow, height 3/10 of diameter of an AME.

**Sternum** Longer than wide in ratio of 14.11. Anterior margin broadly indented. Lateral margins evenly curved, undulating. Posterior projection bluntly pointed, separating coxae 4 by a distance equal to 5/8 of width of a coxa.

**Maxillae** Longer than wide in ratio of 11.9. Lateral margins straight sub-parallel. Anterior margin slightly oblique.

**Labium** Notched at base. Lateral margins gently curved. Anterior margin slightly indented. Wider than long in ratio of 7.6.

**Chelicerae** Retromargin with two teeth, promargin with three of which the median is largest. A carina extends from proximal promarginal tooth to base of chelicera.

**Palp** Spines. Femur, d.0.1.1.1. Tibia, p.1.1.1. Tarsus, v.p.r.d.1.1.1. Tibia with seven trichobothria arranged 2.2.2.1.

**Legs** 1423. Spines. First leg. Femur, d.0.1.1.0. p.0.0.1.0. r.0.0.1.1. Tibia, v.0.2.0. Metatarsus, v.2.2.1. p.r.0.0.1. Second leg. Femur, d.0.1.1.0. p.0.0.0.1. r.0.0.1.1. Tibia, v.1.2.0. p.0.1.1. Metatarsus, v.2.2.1. p.0.1.1. r.d.0.0.1. Third leg. Femur, d.0.1.1.0. p.0.0.0.1. r.0.0.1.1. Tibia, v.0.2.2.

r.0.1.1. Metatarsus, v.2.2.1. p.r.0.1.2. Fourth leg. Femur, d.0.1.1.0. r.0.0.0.1. Tibia, v.1.1.2. p.r.0.1.1. Metatarsus, v.1.1.1.1. p.0.1.0.2. r.1.0.1.2. Trichobothria. First leg. Tibia, 1.1. Metatarsus, 3. Tarsus, 5. Second leg. Tibia, 1.2.1.1.1. Metatarsus, 4. Tarsus, 3. Third leg. Tibia, 2.2.1.1.1. Metatarsus and tarsus, 4. Fourth leg. Tibia, 2.2.2.1.2.1. Metatarsus, 1.2. Tarsus, 4. Subdistal tarsal organ present. Superior claws with nine, inferior claws with two teeth.

**Abdomen** Cribellum large and divided. Posterior spinnerets longer and more slender than anterior pair. Epigynum large (Fig. 625). Internal genitalia simple consisting of a pair of globular vesicles opening anteriorly through a pair of tubular ducts (Fig. 624).

| Palp | 0.85  | 0.45    | 0.65  |            | 0.95   | 2.90  |

**Colour** Carapace pale cream, darkening slightly on anterior portion. Upper slopes, but not the summit, of thorax shaded with black which extends forward as a short band on each side of head. Eyes are individual black patches. Chelicerae pale brown with bosses slightly paler but not conspicuous. Legs pale with dark bands which are more obvious on posterior pairs. Sternum pale cream shaded with black especially posteriorly. Maxillae pale brown and labium darker brown but becoming much paler distally. Abdomen with a pattern as in Fig. 626. Ventral surface pale, shaded with black.

**Carapace** Width of head 5/8 of thorax. Fovea longitudinal, short, relatively deep and situated at summit and upper region of posterior slope. Radial striae faintly discernible.

**Eyes** Group occupies 2/3 of width of head. From in front anterior row slightly procurved and from above posterior row procurved. Ratio of AME.ALE.PME.PLE = 7.9.9.10. AME separated from each other by 6/7 and from ALE by 4/7 of diameter of an AME. Laterals separated by 2/7. PME separated from each other by 7/7 and from PLE by 10/7. MOQ wider behind than in front in ratio of 25.20 and longer than wide behind in ratio of 26.25. Height of clypeus 9/7 of diameter of an AME.

**Sternum** Scutiform. Longer than wide in ratio of 70.55. Posterior projection separates posterior coxae by half diameter of a coxa. Anterior margin concave to accommodate the convexity of labium.

**Maxillae** Longer than wide in ratio of 37.22 and longer than labium in ratio of 37.19.

**Labium** Wider than long in ratio of 24.19. Not notched. Anterior margin concave.

**Chelicerae** Basal carina terminates at the first tooth of the three contiguous teeth on promargin of groove. Of these median tooth largest. Retromargin with two even teeth, almost as large as median tooth on promargin.

**Palp** Spines. Femur, d.1.1.1. Patella, 1.1. Tibia, d.1.1. p.1.2. r.1 distal. Tarsus with numerous spines. Trichobothria. Tibia, two rows of even length each with 5. Claw with eleven teeth.

**Legs** Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.0.1. r.1.1. Patella, 1.1. Tibia, v. 0.2.0. p.0.0.1. r.0. d.1 basal (bristle). Metatarsus, v.2.2.3. p,r.0. Second leg. Femur, d.1.1.1. p,r.1.1. Patella, 1.1. Tibia, v.0.2.0. p,r.1.1. d.1 basal. Metatarsus, v.2.2 and a subwhorl of 5, p,r.1 median. Calamistrum occupies 0.4 of length of segment. Trichobothria. First leg. Tibia, pro-row 4 situated on basal quarter, retro-row 5 extending to midpoint of segment. Metatarsus, 4. Tarsus, 6. Fourth leg tibia with a pro- and retro-row of 5 of almost equal length. Tarsal organ present on all tarsi. Superior claws with nine teeth, inferior claw with two teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 629, 630. The size and depth of the pair of pits situated anteriorly on epigynum are a feature of this species. Cribellum strongly divided. Ratio width to length 27.7, occupies 5/7 of width of spinnerets. Anterior spinnerets separated from each other by 1/3 of diameter of spinneret. Posterior spinnerets slightly longer and much more slender than anterior pair and distal segment distinctly conical.

**Eyes** Group occupies about 4/5 of width of head. From in front anterior row straight by upper margin of eyes. Ratio of AME.ALE.PME.PLE = 6.9.9.9. AME separated from each other by 5/6 and from ALE by 3/6 of diameter of an AME. Laterals separated by 1/6. PME separated from each other by 6/6 and from PLE by 8/6. MOQ wider behind than in front in ratio of 24.17 and as long as wide behind. Height of clypeus 8/6 of diameter of an AME.

**Palp** Tibia and bulb as in Figs. 627, 628.

**Types** Holotype female and allotype male. Nelson. On rock face in forest, Pohara Beach, Golden Bay, 9.iii.1967, C. L. Wilton (Otago Museum).

**Records** Nelson. Same locality and date as types, immature female, C.L.W.

#### Waterea n.gen.

Medium sized (body length 5mm) cribellate spiders. No thoracic patches. Eye group occupying two-thirds of width of head. Both rows more or less straight. AME distinctly smaller than remaining eyes which are sub-equal. Sternum scutiform, longer than wide. Labium as long as wide and notched at base. Chelicerae with two teeth on retromargin and five on promargin. Female palp with trichobothria in a double row on tibia and a single row on tarsus. Claw strongly pectinate. Legs 1423. Trochanters notched. Plumose hairs present. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Superior claws similar and strongly pectinate. Inferior claw with three teeth. Tarsal organ subdistal. Claw tufts and tenent hairs absent. Calamistrum well developed, proximal. Cribellum well developed. Spinning fields divided. Posterior pair of spinnerets slightly longer than anterior pair. Epigynum strongly sclerotized, with strong pair of spinous processes which originate anteriorly and extend back to furrow. Single deep median depression. Internal genitalia with receptacula and short convoluted ducts. Male not known.

Type species *Waterea cornigera* n.sp.

This genus seems to belong with the *Maniho* series but positive placement will need to wait on examination of the male genitalia.

**Colour** Carapace pale yellowish orange with shading on the upper slopes but unshaded on summit between PME and fovea. Legs with bands. Sternum, maxillae and labium yellow brown with mottled shading. Abdomen in poor condition, light brownish grey and showing no pattern.

**Carapace** Head 5/8 of width of thorax and without thoracic patches.

**Eyes** Group occupies 2/3 of width of the head. From in front anterior row straight and posterior row procurved. From above both anterior and posterior rows very slightly recurved. Ratio of AME.ALE.PME.PLE = 4.7.6.7. AME separated from each other by 4/4 and from ALE by 3/4 of diameter of an AME. Laterals narrowly separated. PME separated from each other and from PLE by 6/4. MOQ wider behind than in front in ratio of 18.12 and wider behind than long in ratio of 18.17. Height of clypeus 9/4 of diameter of an AME.

**Sternum** Longer than wide in ratio of 9.8. Anterior margin broadly indented. Posterior projection gently tapered to a point between posterior coxae which are separated by 2/3 of diameter of a coxa.

**Maxillae** Longer than wide in ratio of 5.3 and twice length of labium.

**Labium** As wide as long. Notched at base. Lateral margins only slightly converging and distal margin indented.

**Chelicerae** Porrect. Promargin with five teeth and a carina. Retromargin with two teeth.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Patella, 1.1. Tibia, d.1.1. p.1.0. r.0. Tarsus with numerous spines and a row of four trichobothria. Claw with seven teeth.

**Legs** Trochanters notched. Plumose hairs present. Spines rather small and pale. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.0.1. r.1.1. Patella, 0. Tibia, v.2.2.2. p,r.0.1. d.0. Second leg. Femur, d.1.1.1. p,r.1.1. Patella, 0. Tibia, v.1.2.2. p,r.1.1. d.0. Metatarsus, v.1.2 and subwhorl of 5, p.1.1. r.0.1. Third leg. Femur, d.1.1.1. p,r.1.1. Patella, 0.1. Tibia, v.1.1.2. p,r,d.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p,r.1.1. Fourth leg. Femur, d.1.1.1. p.0.1. r.0.0. Patella, 0.1. Tibia, v.1.1.0. p,r,d.1.1. Metatarsus, v.1.2 and subwhorl of 5, p.1.1. r.1 calamistrum 1. Calamistrum of fine hairs, in a single closely spaced row occupying less than a quarter of length of segment. Trichobothria. Second leg. Tibia, p.1. r.2. Metatarsus, 4. Tarsus, 3. Superior claws with six teeth, inferior claw with three teeth.

**Abdomen** Sub-globular in shape. Posterior spinnerets slightly longer than anterior pair. Distal segment conical and half length of basal segment. Cribellum divided and spinning fields well separated. Epigynum and internal genitalia as in Figs. 631, 632.

**Type** Holotype female. Te Araroa, East Cape, December 1948, R. K. Dell (Dominion Museum).

### **Reinga n.gen.**

Medium to large (6.5-12.5mm in body length) cribellate spiders. Eyegroup compact, occupying approximately one half of width of head. Anterior row straight. Posterior row gently recurved. AME and PME of similar size while lateral eyes are distinctly large. Sternum, longer than wide. Labium notched at base, longer than wide. Chelicerae with boss. Retromargin with two and promargin with seven teeth. Legs 4123. Trochanters slightly notched. No plumose hairs. Trichobothria in a double row on tibiae and a single row on metatarsi and tarsi. Superior claws similar, strongly pectinate. Inferior claw with two teeth. Tarsal organ subdistal. Female palp, with trichobothria in a double row on the tibia. Claw strongly pectinate. Calamistrum well developed, proximal. Cribellum much wider than long, deeply notched posteriorly. Spinning field well developed, divided. Epigynum with a pair of stout spines and a median oval or rectangular thinly sclerotized area. Internal genitalia with distinct receptacula and stout ducts which may be convoluted.

Type species *Reinga media* n.sp.

One of the species, *R. aucklandensis* (Marples), was originally placed in the Australian and Pacific

*Syroris* which is characterized by the large number of cheliceral teeth and possesses a seemingly similar epigynum. However from the figures given by Berland (1924) this genus lacks the paired spines characteristic of *Reinga* and is unlikely to be closely related to it.

| Palp | 1.17     | 1.11    |       | 1.22       |        | 3.50  |

**Colour** Carapace yellow with a grey crescent anterior to thoracic groove, directed anteriorly and with further indistinct sooty marks at bases of legs and in eye region. Eyes surrounded with black. Abdomen grey with white markings. A grey stripe on the mid-dorsal surface with two pairs of white markings forming a y pattern, followed by three pairs of dark chevrons and alternately three white chevrons. Lateral surface of abdomen grey mottled with white. Ventral surface grey with a white line bordering each side. Spinnerets grey. Sternum yellow, speckled with black, denser on the margins. Legs yellow, strongly ringed with grey. Chelicerae orange.

Fig. 633 *Reinga apica* n.sp. female.

**Carapace** Rather elongate. Thoracic portion elliptical with posterior margin straight. Head region distinct and elongate.

**Eyes** From above anterior row recurved and posterior row procurved. From in front anterior row straight and posterior row recurved. Ratio of AME.ALE.PME.PLE = 3.4.3.5. AME separated from each other and from the ALE by 2/3 of diameter of an AME. Lateral eyes contiguous. PME separated from each other and from the PLE by a distance equal to 4/3. MOQ wider behind than in front in ratio of 10.8 and wider behind than long in ratio of 10.9. Height of clypeus equal to diameter of an AME.

**Sternum** Scutiform, longer than wide in the ratio of 5.4. Anterior margin straight, extending over the entire width of sternum. Lateral margins gently undulating. Posterior projection sharp, separating coxae 4 by 3/5 of width of a coxa.

**Maxillae** Lateral margins divergent, wider at tip than base in the ratio of 5.3.

**Labium** Notched at the base. Lateral margins slightly convergent, anterior margin indented. Twice as wide at the base as long.

**Chelicerae** Slender. Retromargin with two teeth, promargin with seven. A carina extends down ventral surface from the proximal promargin tooth.

**Palp** Spine. Femur, d.0.1.1.1. Patella, d.0.1. Tibia, p.1.1.1.1. r.1.0.0. Tarsus many. Claw straight, with 10 teeth. Tibia with three trichobothria arranged 1.2.

**Legs** Spines. First leg. Femur, d.0.1.1.0.1. p.0.0.0.0.1. Tibia, v.2.2.1. p.r.1.0.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. Second leg. Femur, d.0.1.1.0.1. p.0.1.0.0.1. r.0.0.0.0.1. Tibia, v.2.2.1. p.r.1.0.1. d.0.1.0. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Third and fourth legs. Femur, d.0.1.1.0.1. p.0.0.1.0.1. r.0.0.0.0.1. Patella, d.0.1. Tibia, v.2.1.1. p.r.1.0.1. d.0.0.1. Metatarsus, v.2.2.2. p.r.0.1.2. Trichobothria few. First leg. Tibia, 2.1.1. Metatarsus, 2.

Tarsus, 3. Tibia of legs 2-4 with 2.1. Metatarsus of fourth leg with single trichobothrium. Tarsal organ absent. Superior claws with ten, inferior with two teeth.

**Abdomen** Cribellum relatively small, with notch on postero-median surface and divided. Epigynum and internal genitalia as in Figs. 634, 635.

**Type** Holotype female. Auckland District, v.1951, B. J. Marples (Otago Museum).

**Colour** Carapace pale orange brown, darkening slightly anteriorly. Chelicerae and anterior portion of head darker, lateral condyles paler. Legs yellowish brown with dark bandings. Sternum yellow brown, darker at margins. Maxillae and labium orange brown with white distal margins. Abdomen dark brown with a pale pattern as in Fig. 633. Ventral surface dark, bordered on each side by a pale band. Pair of pale spots immediately behind the furrow followed by several pairs of smaller spots.

**Carapace** Width of head 0.74 of carapace.

**Eyes** The group occupies slightly over half width of head. From in front anterior row straight and from above posterior row very slightly recurved. Ratio of AME.ALE.PME.PLE = 6.7.6.7. AME separated from each other by distance equal to their radius and from the ALE by 4/6. Lateral eyes separated by 2/6 of the diameter of an AME. PME separated from each other by 7/6 and from the PLE by 9/6. MOQ wider behind than in front in ratio of 19.15 and wider behind than long in ratio of 19.18. Height of clypeus equal to 9/6 of diameter of an AME.

**Sternum** Longer than wide in ratio of 56.42. Shield shaped with narrow point posteriorly which separates posterior coxae.

**Maxillae** Longer than greatest width in ratio of 7.4 and inclined slightly over the labium.

**Labium** Longer than wide in ratio of 20.18, notched at each side at base and with a concave distal margin. Shorter than maxillary lobe in ratio of 20.35.

**Chelicerae** Viewed laterally longer than wide in ratio of 60.38. Fang rather long. Promargin of furrow oblique, with seven teeth. Three nearest the base of the fang and sixth from the fang longer. Retromargin with two small widely separated teeth.

**Legs** Spines. First leg. Femur, typical prolateral spine present, d.1.1.1. p.r.0.1. Tibia, v.2.2.2. p.r.1.1.1. Metatarsus, v.2.2 and a distal subwhorl of 5, p.1 median r.1 median. Second leg. Femur, d.1.1.1. p.r.1.1. Tibia, v.1.2.2. p.r.1.1. Metatarsus, v.2.2 and a distal subwhorl of 5, p.1.1. r.1.1. Calamistrum occupies 0.27. Trichobothria. Tibia, pro-row 4 extending to the midpoint, retro-row 5 extending beyond midpoint. Metatarsus, 5. Tarsus, 6. Superior claws with ten teeth, inferior claw with two. Trochantera slightly notched.

**Abdomen** Cribellum divided, four times as wide as long, width slightly less than 4/5 of anterior spinnerets. Anterior spinnerets separated by about a 1/5 of diameter

of a spinneret. Posterior spinnerets narrower, slightly longer and distal segment cone shaped. Epigynum and internal genitalia as in Figs. 639, 640.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, d.p.1.1. r.0. Few spines on tarsus. Trichobothria on tibia in two rows of three. Claw with ten teeth.

**Type** Holotype female. North Auckland. Cape Reinga, 7.i.1967, R. R. Forster, D. R. Forster (Otago Museum).

**Records** Female and two immature specimens from same locality.

**Colour** Carapace pale cream with a slight tinge of orange about anterior margins. Eyes on black spots. Legs pale without dark bands. Sternum pale cream and maxillae, labium and chelicerae very pale orange brown. Abdomen with dark shading within which may be discerned a pale St. Andrew's cross anteriorly, followed by a number of pale chevrons which decrease in size posteriorly.

**Carapace** Width of head 5/7 of carapace.

**Eyes** The group occupies 5/8 of the width of the head. From in front anterior row straight and from above

Figs. 644 a-d *Reinga waipoua* n.sp. Fig. 644a Retrolateral view of male palp. Fig. 644b Ventral view of male palp. Fig. 644c Epigynum. Fig. 644d Internal genitalia.

posterior row straight. Ratio of AME.ALE.PME.PLE = 3.5.4.5. AME separated from each other by 3/3 and from the ALE by 2/3 of diameter of an AME. Laterals contiguous. PME separated by 4/3 and from the PLE by 5/3 of diameter of an AME. MOQ wider behind than in front in ratio of 14.8 and wider behind than long in ratio of 14.12. Height of clypeus equal to 5/3 of diameter of an AME.

**Sternum** As wide as long. Anterior margin more or less straight. Posterior projection short and separates posterior coxae by slightly less than half diameter of a coxa.

**Maxillae** Inclined slightly over labium. Longer than wide in ratio of 26.16 and longer than labium in ratio of 26.15.

**Labium** As wide as long. Notched at the base. Distal margin indented.

**Chelicerae** Promargin with a row of seven contiguous teeth. Retromargin with two widely separated small teeth.

**Palp** Spines. Femur, d.0.1.1. p.r.0. Patella, 0.1. Tibia, p.d.1.1. r.0. Trichobothria. Tibia, p.1. r.1.1.1. Claw with seven teeth.

**Legs** Fourth trochanter slightly notched. Spines of average length. First leg. Femur, prolateral spine present, d.1.1.1. p.0.1. r.0. Patella, 0. Tibia, v.1.2.1. p.0.1. r.d.0. Metatarsus, v.1.2 and a subwhorl of 5, p.r.0. Second leg. Femur, d.1.1.1. p.0.1. r.0. Patella, 0. Tibia, v.1.1.1. p.1.1. r.d.0. Metatarsus, v.1.2 and a subwhorl of 5, p.r.1 median. Third leg. Femur, d.1.0.1. p.0.1. r.0. Patella, 0.1. Tibia, v.0.1.2. p.d.r.1.1. Metatarsus, v.0.2 and subwhorl of 5, p.0.2. r.0.1. Fourth leg. Femur, d.1.0.1. p.0. r.0.1. Patella, 0. Tibia, v.1.1.2. p.r.d.1.1. Metatarsus, v.2.2 and a subwhorl of 5, p.1.2. r.1 calamistrum 1. Calamistrum occupies about 1/3 of segment. Trichobothria. Tibia, p.2. r.3. Metatarsus, 2. Tarsus, 2 and tarsal organ. Superior claws with eight teeth, inferior claw with two teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 644 c, d. Posterior margin of cribellum pointed and medially notched. Spinning fields oval and well separated

about same length as anterior pair but much more slender. Distal segment of posterior spinneret 1/3 of length of basal segment and conical.

MALE

**Eyes** The eyegroup occupies 3/5 of the width of the head. From above anterior row recurved and posterior row slightly procurved. From in front anterior row straight and posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 2.5.4.5. AME separated from each other by 2/2 and from the ALE by 3/2. Lateral eyes contiguous. PME separated by 3/2 and from the PLE by 5/2 of diameter of an AME. MOQ wider behind than in front in ratio of 11.6 and wider behind than long in ratio of 11.9. Height of clypeus equal to twice diameter of an AME.

**Chelicerae** Length of chelicerae equal to 5/11 of length of carapace. Retromargin with single tooth near base of fang. Promargin with row of four strong teeth followed by a small tooth at anterior margin of carina which extends to base of chelicera.

**Palp** As in Figs. 644 a, b. Cymbium broad and shallow.

**Legs** Superior claws with 12 teeth. Inferior claw with two teeth. Calamistrum with row of twelve hairs on proximal surface.

**Abdomen** Cribellum narrow, two and a half times as wide as long. Spinning field small.

**Type** Holotype male. North Auckland. Waipoua, leaf litter, January 1952, W. R. McGregor (Otago Museum). Allotype female. Omahu Kauri forest, 335 m, 25.ii.1967, K. A. J. Wise (Auckland Museum).

Fig. 645 *Mamoea rufa* (Berland) female with eggsac.

#### *Mamoea* n.gen.

Large (7-12mm in body length) ecribellate spiders. Eye-group occupying little more than one half of the width of the head. Eyes in two more or less straight rows. AME equal in size to PME or slightly smaller. Lateral eyes distinctly larger. Sternum scutiform, as long as or longer than wide. Labium with basal notch, longer than wide. Chelicerae with boss. Retromargin with 3-5 and promargin with from 4-10 teeth. Legs 1423 or 4123. No plumose hairs. Tibiae and metatarsi of first two pairs with two rows of up to five stout spines on ventral surfaces. Trochantera with shallow notches. Trichobothria numerous. Double row on tibiae and a single row on metatarsi and tarsi. Thick scopula of short hairs on ventral surface of the tarsi and disto-ventral surfaces of metatarsi of third and fourth pairs of legs. Preening combs lacking. Superior claws similar, strongly pectinate. Inferior claw smooth. Claw tufts and tenent hairs lacking. Spinnerets relatively small and compact. Anterior and posterior pairs of equal length. Colulus small, conical, closely clothed with hairs. Epigynum strongly sclerotized, usually with a pair of spines. Internal genitalia with small receptacula and convoluted ducts (Fig. 650). Embolus strongly filiform. Originating prolaterally and directed across to retrolateral surface before twisting forward to meet conductor. Conductor divided distally with embolus following outer branch (Fig. 648). Median apophysis well developed as a membranous structure which is never hooked. The median apophysis is lacking in the *bicolor* group of species.

Type species *Rubrius rufus* Berland 1931.

This genus includes some of the commonest and most conspicuous forest floor spiders. Only four

species have been recorded previously. Three (*bicolor*, *rufa* and *mandibularis*) were originally placed in *Rubrius* while *pilosa* was placed in *Cambridgea*. The genus is very distinctive and cannot be confused with any other New Zealand genera, although in general appearance it may be mistaken in the field for *Amphinecta* which is often found associated with it. The spiders are usually found beneath and inside rotten logs or under stones on the forest floor although some have been recorded from tunnels in the ground. This latter occurrence would seem however to be fortuitous. Some species extend into the sub-alpine of the South Island. A small web is constructed but this may only function as a retreat. Young spiders have been found occupying cylindrical tubes, open at each end. The eggsac is purse-shaped and is hung from the substrate where the spider is found. Because these spiders are readily trapped in pitfalls and are undoubtedly active on the forest floor at night it is thought that most prey is captured by hunting.

**Colour:** Head region of cephalothorax dark red brown. Thoracic region paler with four streaks radiating out from fovea. Legs yellow brown with a few darker patches. Dorsal surface of abdomen heavily shaded but seven transverse bands and chevrons visible on the posterior portion separated by distinct pale areas. Ventral surface of abdomen with a distinct median longitudinal band and a few scattered dark patches.

**Eyes:** Eye-group occupies 2/5 of width of head. Ratio of AME:ALE:PME:PLE = 5.6:5.6. AME separated from each other by 4/5 and from the ALE by 6/5 of the diameter of an AME. Lateral eyes separated by 2/5. PME separated from each other by 7/5 and from the PLE by 9/5. MOQ wider behind than in front and wider behind than long in ratio of 17:14. Height of clypeus equal to 3/5 of diameter of an AME.

**Chelicerae:** Retromargin with three, promargin with six teeth.

**Legs:** Tibia on first leg v.2.2.2.2.2. Tibia of second leg v.2.2.2.2. Metatarsus of both first and second legs v.2.2.2.

**Palp:** Palp as in Figs. 647, 648. Bulb extends back over tibia. Median apophysis small and finger-like as in *grandiosa*. Embolus slightly curved.

This species was described by Berland from Campbell Island but it appears that a tube of spiders collected from the port of Bluff while awaiting the sailing of the expedition ship was sent to Berland along with the Campbell Island material. The type locality is Bluff and the genus is not recorded south of Stewart Island. The species ranges over the southern portion of the east coast of the South Island.

##### MALE

##### Measurements

|      | Carapace | length  | 3.30  | width      | 2.50   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 3.75  | width      | 2.10   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 3.05     | 1.30    | 3.35  | 3.00       | 1.45   | 12.15 |
| 2    | 2.50     | 1.15    | 2.20  | 2.25       | 1.15   | 9.25  |
| 3    | 2.15     | 1.05    | 1.70  | 2.10       | 0.95   | 7.95  |
| 4    | 2.95     | 1.10    | 2.70  | 3.20       | 1.25   | 11.20 |
| Palp | 1.25     | 0.50    | 0.50  |            | 1.50   | 3.75  |

**Colour** Carapace pale orange yellow with lateral surfaces of the head, upper lateral surfaces and posterior slope shaded with black but without black shading on lateral margins. Sternum pale cream with dark shading on posterior projection and on areas adjacent to each of the coxae. Abdomen pale cream with a few dark flecks on lateral surfaces. A dark median band becomes a herringbone pattern on the posterior half. On each side of ventral surface a dark band extends between book-lung openings and spinnerets. Bands curved so that the convexities of curves are towards each other. Posteriorly bands connected to each other by a triangular dark patch just in front of spinnerets.

**Eyes** Group occupies 3/5 of width of head. From above the posterior row straight and anterior row slightly recurved. From in front both rows procurved. Ratio of AME.ALE.PME.PLE = 5.7.6.6. AME separated from each other and from ALE by a distance equal to 3/5 of diameter of an AME. Laterals separated by 3/5. PME separated from each other and from the PLE by 6/5. MOQ wider behind than in front in ratio of 18.13 and wider behind than long in ratio of 18.16. Height of clypeus equal to 9/5 of diameter of an AME.

**Sternum** Scutiform. Anterior margin straight. Posterior projection separates posterior coxae by half diameter of a coxa.

**Maxillae** Longer than wide in the ratio of 26.14 and twice length of labium.

**Labium** Wider than long in ratio of 14.13. Notched on each side at base. Distal margin indented.

**Chelicerae** Promargin with carina and four teeth. Retro-margin with three teeth.

**Palp** Tibial processes and bulb as in Figs. 651, 652. Trichobothria. Tibia, in three rows, p. 2, d.r.4. Cymbium, 4.

**Legs** All trochanters notched. Ventral surfaces of tarsi lightly scopulate. Spines. First leg. Femur, d.1.1.0. p.0.1. r.0. Tibia, v.2.1.2.2.2.2.0. p.r.0. Metatarsus, v.1.2.2.0. p.r.0.0.1. Second leg Femur, same as first leg Tibia, v.1.2.2.2. p.0.1.1. r.0. Metatarsus, v.2.1.2.0. p.1.1.2. r.0.1.1. Trichobothria. First leg. Tibia, two rows of 4. Metatarsus, 7. Tarsus, 6. Superior claws with nine teeth, inferior claw with two teeth, the basal one smaller.

**Abdomen** Colulus conical with from ten to twelve setae. Posterior spinnerets as long as anterior spinnerets but more slender.

##### FEMALE

##### Measurements

|      | Carapace | length  | 3.50  | width      | 2.60   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 5.20  | width      | 3.50   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 3.00     | 1.25    | 2.90  | 2.15       | 1.30   | 10.60 |
| 2    | 2.55     | 1.20    | 2.20  | 2.00       | 1.05   | 9.00  |
| 3    | 2.35     | 1.15    | 1.75  | 2.10       | 0.95   | 8.30  |
| 4    | 3.15     | 1.20    | 2.95  | 3.30       | 1.15   | 11.75 |
| Palp | 1.20     | 0.60    | 0.95  |            | 1.30   | 3.05  |

**Eyes** Group occupies 3/5 of width of head. From in front both rows procurved and from above straight. Ratio of AME.ALE.PME.PLE = 5.7.6.7. AME separated from each other and from the ALE by a distance equal to diameter of an AME. Laterals separated by 4/5. PME separated from each other and from the PLE by 9/5. MOQ wider behind than in front in ratio of 21.15 and wider behind than long in ratio of 21.17. Height of clypeus equal to 11/5 of diameter of an AME.

**Types** Holotype male. Croydon Bush, Gore, 19.ii.1966, R. R. Forster, C. L. Wilton. Allotype

female. Taieri Bush, C. L. Wilton (Otago Museum).

This small species seems related to *M. rufa*.

**Mamoea otira n.sp.**

Figs. 655-658

**MALE**

**Measurements**

|      | Carapace | length  | 5.95  | width      | 4.59   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 6.29  | width      | 3.74   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 6.80     | 2.21    | 7.31  | 5.44       | 2.89   | 24.65 |
| 2    | 5.44     | 2.21    | 5.27  | 4.59       | 2.38   | 19.69 |
| 3    | 4.93     | 1.87    | 3.74  | 4.42       | 2.04   | 17.00 |
| 4    | 6.29     | 2.55    | 5.95  | 6.80       | 2.21   | 23.80 |
| Palp | 2.55     | 0.85    | 0.68  |            | 2.89   | 6.97  |

**Colour** Chelicerae, labium, maxillae and head region of carapace dark red brown. Legs orange brown. Dorsal surface of abdomen heavily pigmented but 6 chevrons may be distinguished on the postero-dorsal surface. Ventral surface of abdomen cream with two broken rows of dark patches.

**Eyes** Eyegroup occupies 4/7 of width of head. Ratio of AME.ALE.PME.PLE = 4.6.5.6. AME separated from each other and from ALE by a distance equal to 3/5 of the diameter of an AME. Lateral eyes are separated by 2/4. PME separated from each other and from PLE

by a distance equal to 7/4. MOQ wider behind than in front in ratio of 17.11 and wider behind than long in ratio of 17.13. Width of clypeus equal to 3/4 of diameter of an AME.

**Chelicerae** Retromargin with three teeth, promargin with five teeth.

**Legs** Spines. First leg with 2.2.1.1.2 on ventral surface of tibia and 2.2.2 on ventral surface of metatarsus. Second leg with 2.2.2.2 on ventral surface of tibia, 2.1.2.1 on ventral surface of metatarsus.

**Palp** (Figs. 657, 658). Tibial process relatively short. Membraneous area of the conductor short.

**FEMALE**

**Measurements**

|      | Carapace | length  | 6.12  | width      | 4.25   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 8.84  | width      | 4.25   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 5.44     | 2.55    | 5.95  | 4.76       | 2.55   | 23.97 |
| 2    | 5.27     | 2.38    | 4.59  | 4.25       | 2.21   | 18.70 |
| 3    | 4.42     | 2.04    | 2.72  | 3.57       | 1.87   | 14.62 |
| 4    | 6.29     | 2.38    | 5.61  | 5.61       | 2.38   | 22.27 |
| Palp | 2.55     | 0.85    | 1.36  |            | 2.55   | 7.31  |

Similar to the male in most characters. The epigynum is heavily sclerotized with the median plate somewhat rounded, not as angular as *westlandica*. The internal genitalia are typical but the large ducts appear flattened and lack the grooves found in *westlandica*.

Figs. 655-658 *Mamoea otira* n.sp. Fig. 655 Epigynum. Fig. 656 Internal genitalia. Fig. 657 Ventral view of the male palp. Fig. 658 Tibial processes of male palp. Figs. 659-662 *Mamoea westlandica* n.sp. Fig. 659 Epigynum. Fig. 660 Internal genitalia. Fig. 661 Tibial processes. Fig. 662 Ventral view of male palp.

**Types** Holotype male, allotype female. Westland. Kelly's Range, Otira, 4,000 ft, under stones, 26.iv.1956, R. R. Forster (Otago Museum).

This species is related to *westlandica* and *florae*. The three species are readily separated by the form of the male palp and the epigynum and internal genitalia which form a series of progressive simplifications from south to north. In the male palp the membraneous area of the conductor is reduced with the series *westlandica*, *otira* and *flora* as is the complexity of the internal genitalia.

**Mamoea westlandica n.sp.**

Figs. 659-662

**MALE**

**Measurements**

|      | Carapace | length  | 5.95  | width      | 4.08   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 6.80  | width      | 4.08   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 5.95     | 2.55    | 7.31  | 5.95       | 3.06   | 24.82 |
| 2    | 5.10     | 1.87    | 4.25  | 4.25       | 2.21   | 17.68 |
| 3    | 4.25     | 1.70    | 3.23  | 3.91       | 1.70   | 14.79 |
| 4    | 5.10     | 1.70    | 5.10  | 4.25       | 1.70   | 17.85 |
| Palp | 3.74     | 1.36    | 1.19  |            | 4.42   | 10.71 |

**Colour** Head region of carapace reddish brown, thoracic region paler. Dorsal surface of abdomen strongly patterned with median band which on the posterior half of surface extends laterally to form five pairs of chevrons. Pale areas on the lateral margin of median band enclosed by distinctive chevrons. Ventral surface of abdomen creamy white with few scattered black patches. Chelicera, labium and maxillae dark reddish brown. Sternum orange brown with darker chocolate shading along outer surfaces. Legs reddish brown with dark patches.

**Eyes** Eyegroup occupies half of diameter of head. From above both rows are straight. Ratio of AME.ALE.PME.PLE = 5.7.5.6. AME separated from each other and from ALE by a distance equal to 3/5 of diameter of an AME. Lateral eyes separated by 3/5. PME separated from each other by 7/5 and from the PLE by 8/5. MOQ wider behind than in front and wider behind than long in ratio of 17.13. Height of clypeus 4/5 of diameter of an AME.

**Chelicerae** Strong with a prominent lateral boss. Retromargin with four teeth, promargin with 10 teeth. The fang is long.

**Legs** Metatarsus of first leg with v.1.2.2.2.1 spines. Second leg with v.2.2.2 on both tibia and metatarsus.

**Palp** (Figs. 661-662). Retrolateral tibial process spini-form. Embolus strong and widely curved so that base is visible beyond cymbium when viewed retrolaterally. Conductor with large membraneous sheath.

**FEMALE**

**Measurements**

|      | Carapace | length  | 5.95  | width      | 4.08   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 6.12  | width      | 3.91   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 4.59     | 2.04    | 4.42  | 3.91       | 2.21   | 17.17 |
| 2    | 3.91     | 2.04    | 3.40  | 3.23       | 1.70   | 14.28 |
| 3    | 3.06     | 1.36    | 2.72  | 2.89       | 1.53   | 11.56 |
| 4    | 4.93     | 2.04    | 4.59  | 4.59       | 1.87   | 18.02 |
| Palp | 2.38     | 0.85    | 1.70  |            | 2.38   | 7.31  |

General characters similar to the male. Epigynum as in Figs. 659. Internal genitalia consist of a broad, flattened duct coiled around the more slender duct returning to basal vesicle. This thinner duct with a small accessory lobe near the mid length. External opening from an oval opening in the transverse portion of the larger duct.

**Types** Holotype male, allotype female. Fiordland. Lake Te Au, south arm of Te Anau, 12.i.-1953, R. R. Forster (Otago Museum).

| 1    | 3.06     | 0.85    | 3.06  | 2.38       | 1.38   | 10.73 |
| 2    | 2.38     | 1.19    | 2.38  | 2.21       | 1.19   | 9.35  |
| 3    | 2.38     | 1.02    | 2.04  | 2.04       | 0.68   | 8.16  |
| 4    | 3.23     | 1.02    | 2.72  | 3.57       | 1.53   | 12.07 |
| Palp | 1.53     | 0.51    | 1.02  |            | 1.53   | 4.59  |

**Colour** Head region of carapace pale reddish brown with grey shading on lateral surfaces. Thoracic region yellow brown. Chelicerae, labium and maxillae reddish brown. Sternum orange brown with darker marginal shading. Legs yellow brown with bands of darker shading. Abdomen cream with dark median longitudinal band on dorsal surface which has a pale median area to half way where it is expanded laterally over posterior half into six or seven chevrons. Three parallel longitudinal bands extend down ventral surface with two outer bands joining posteriorly in front of spinnerets.

**Eyes** Eyegroup occupies 2/3 of width of head. From above both rows are straight. Ratio of AME.ALE.PME.PLE = 4.5.4.5. AME separated from each other and from ALE by 2/4 of the diameter of an AME. Lateral eyes separated by a distance equal to 3/4. PME separated from each other by 4/4 and from the PLE by 5/4. MOQ wider behind than in front in ratio of 14.10 and wider behind than long in ratio of 14.11. Height of clypeus equal to 3/4 of diameter of an AME.

**Chelicerae** Retromargin with three, promargin with five teeth.

**Legs** First leg with v.2.2.2.2.1 spines on tibia and v.2.2.2 on metatarsus. Second leg with v.2.2.2.1 on tibia and v.2.2.2 on metatarsus.

**Abdomen** Epigynum strongly sclerotized with a prominent median lobe (Fig. 663). Internal genitalia relatively simple as in Fig. 664.

MALE

Measurements

|      | Carapace | length  | width |            |        |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | width |            |        |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |

| Palp | 1.87     | 0.68    | 0.51  |            | 2.38   | 5.44  |

**Colour** Carapace and chelicerae dark red brown. Legs yellow brown. Dorsal surface of abdomen with five chevrons on posterior half.

**Eyes** Eyegroup occupies 3/5 of width of head. Ratio of AME.ALE.PME.PLE = 4.5.4.5. AME separated from each other and from the ALE by a distance equal to 3/4 of diameter of an AME. Lateral eyes separated by the same distance. PME separated from each other by a distance equal to 7/4 and from the PLE by 6/4. MOQ wider behind than in front in ratio of 15.11 and wider behind than long in ratio of 15.13. Height of clypeus equal to 3/4 of diameter of an AME.

Figs. 663-670 *Mamoea maorica* n.sp. Fig. 663 Epigynum. Fig. 664 Internal genitalia. Fig. 665 Ventral view of male palp. Fig. 666 Tibial processes of male palp. Figs. 667-670 *Mamoea florum* n.sp. Fig. 667 Epigynum. Fig. 668 Internal genitalia. Fig. 669 Tibial processes of male palp. Fig. 670 Ventral view of male palp.

**Chelicerae** Retromargin with three widely separated teeth. Promargin with a single tooth near the base of the fang and four further teeth at proximal margin of the groove.

**Legs** First leg with v.2.2.2.2 spines on tibia and v.2.2.2 spines on metatarsus. Second leg with v.1.2.2.2.1 spines on tibia and v.2.2.2 spines on metatarsus.

**Palp** The form of the palp is shown in Figs. 669, 670.

FEMALE

Measurements

|      | Carapace | length  | width |            |        |       |

| Palp | 2.38     | 1.02    | 0.85  |            | 3.23   | 7.48  |

**Colour** Carapace dark reddish brown, somewhat lighter on thoracic region. Legs yellow brown with faint markings. Sternum reddish brown with marginal shading. Dorsal surface of abdomen heavily shaded with black but with from 5 to 6 transverse bands on posterior half. Ventral surface cream apart from two broken longitudinal bands.

**Eyes** Eyegroup occupies 4/9 of diameter of head. From above both rows are straight. Ratio of AME.ALE.PME.PLE = 4.7.6.7. AME separated from each other and from the ALE by a distance equal to diameter of an AME. Lateral eyes separated by a distance equal to 2/4 of diameter of an AME. PME separated from each other by 6/4 and from the PLE by 9/4. MOQ wider behind than in front in ratio of 9.6 and wider behind than long in ratio of 9.7. Height of clypeus equal to 1/2 diameter of an AME.

**Chelicerae** Chelicerae furrow long. Four teeth on retro-marginal and eight on promarginal.

*Legs* Spines. Tibia of first leg v.2.2.2.2. Second leg v.2.2.2.2. Metatarsi of first and second pairs with v.2.2.2.

*Palp* (Figs. 671, 672) Tibial process short and excavated apically. Distal plate well developed. Embolus strongly curved.

##### Measurements

|         | Carapace | length  | width |                         |
|---------|----------|---------|-------|-------------------------|
| Abdomen | length   | 4.25    | 2.89  |                         |
|         | length   | 3.74    | 2.55  |                         |
| Leg     | Femur    | Patella | Tibia | Metatarsus Tarsus Total |
| 1       | 3.06     | 0.85    | 2.55  | 2.04 1.53 10.03         |
| 2       | 2.72     | 0.85    | 2.38  | 1.87 1.19 9.01          |
| 3       | 2.72     | 0.85    | 1.87  | 1.87 0.85 8.16          |
| 4       | 3.06     | 1.36    | 2.38  | 2.55 1.02 10.37         |
| Palp    | 1.87     | 0.51    | 1.02  | 1.36 4.76               |

**Colour** Carapace orange brown. Legs yellow brown. Dorsal surface of abdomen heavily shaded with two pairs of round white spots on anterodorsal surface and five transverse pale bands on posterior half. Ventral surface with three longitudinal dark stripes of which the median is weakest.

**Eyes** Eyegroup occupies 4/9 of width of head. Ratio of AME.ALE.PME.PLE = 3.5.3.4. AME separated from each other by 2/3 and from ALE by 4/3 of diameter of an AME. Lateral eyes separated by 2/3. PME separated from each other by 6/3 and from PLE by 8/3. MOQ wider behind than in front in ratio of 12.8 and wider behind than long in ratio of 12.9. Height of clypeus equal to 2/3 of diameter of an AME.

**Chelicerae** Retromargin with three teeth, promargin with six.

**Legs** Tibia of first pair of legs with v.2.2.2.1 spines. Metatarsus of first pair of legs and tibia and metatarsus of second pair of legs with v.2.2.2. Epigynum as shown in Fig. 697. Internal genitalia as in Fig. 698.

**Type** Holotype female. Puysegur Point. Southland, xi.1921, R. S. Sutherland (Canterbury Museum).

**Records** Fiordland. Lake Monk, 16.i.1960, M. A. Chapman. Wilderness, 18.i.1946, R.R.F. Hollyford, Gunns Camp, 16.v.1960, J. Winter. Deep Cove, 4.i.1958, R. A. C. Cumber. ##### Measurements

|         | Carapace | length  | width |                         |
|---------|----------|---------|-------|-------------------------|
| Abdomen | length   | 2.65    | 2.00  |                         |
|         | length   | 4.10    | 2.60  |                         |
| Leg     | Femur    | Patella | Tibia | Metatarsus Tarsus Total |
| 1       | 2.05     | 0.92    | 1.80  | 1.55 1.00 7.32          |
| 2       | 1.82     | 0.87    | 1.43  | 1.35 0.88 6.35          |
| 3       | 1.62     | 0.80    | 1.05  | 1.50 0.75 5.72          |
| 4       | 2.12     | 0.88    | 1.80  | 2.20 1.00 8.00          |
| Palp    | 1.15     | 0.50    | 0.75  | 1.05 3.45               |

**Colour** Resembles the other species of the bicolor group but only slight indication of pattern. Ventral surface with three longitudinal dark bands.

**Eyes** Group occupies 3/5 of width of head. Ratio of AME.ALE.PME.PLE = 4.5.5.5. AME separated from each other by 3/4 and from the ALE by a distance equal to the diameter of an AME. Laterals narrowly separated. PME separated from each other by 6/4 and from PLE by 8/4. MOQ wider behind than in front in ratio of 16.11 and wider behind than long in ratio of 16.14. Height of clypeus equal to 6/4 of diameter of an AME.

**Sternum, maxillae, labium and chelicerae** typical.

**Legs and palp** with typical spination.

**Abdomen** Epigynum and internal genitalia as in Figs. 707, 708.

#### MALE

##### Measurements

|         | Carapace | length  | width |                         |
|---------|----------|---------|-------|-------------------------|
| Abdomen | length   | 3.00    | 2.35  |                         |
|         | length   | 3.50    | 2.25  |                         |

| 4       | 2.10        | 0.95        | 1.70       | 2.05 0.90 7.70          |
| Palp    | 1.20        | 0.50        | 0.75       | 0.95 3.40               |

**Colour** Carapace reddish brown with slight radial shading. Abdomen very dark with hardly any pattern. Ventral surface of abdomen pale with three dark longitudinal bands.

**Eyes** Ratio of AME.ALE.PME.PLE = 4.6.4.5. AME separated from each other and from ALE by 3/4 of diameter of an AME. PME separated from each other and from the PLE by 6/4. MOQ wider behind than in front in ratio 14/9 and wider behind than long in ratio 14.11. Height of clypeus equal to 9/4 of diameter of an AME.

**Sternum, maxillae, labium and chelicerae** typical.

**Legs and palps** with normal spination.

**Abdomen** Epigynum and internal genitalia as in Figs. 703, 704.

| 4       | 2.25        | 1.00        | 8.20       |
| Palp    | 1.00        | 3.40        |            |

*Colour* Carapace reddish brown with slight radial shading. Abdomen brown and shiny with slight indications of pale chevrons. Ventral surface of abdomen pale with slight shading posteriorly.

*Eyes* Group occupies 3/5 of width of head. Ratio of AME.ALE.PME.PLE = 5.6.6.7. AME separated from each other and from the ALE by 3/5 of their diameter. PME separated from each other by 6/5 and from the PLE by 4/5. MOQ wider behind than in front in ratio of 18.13 and wider behind than long in ratio of 18.14. Height of clypeus 7/5 of diameter of an AME.

*Sternum, maxillae, labium and chelicerae* are typical.

*Legs and palps* with normal spination.

*Abdomen* The epigynum and internal genitalia as in Figs. 709, 712.

*Type* Holotype female. Marlborough. Curious Cove, Queen Charlotte Sound, leafmould, 29.iii.1948, D. Hurley (Otago Museum).

*Records* Marlborough. Waterfall Bay, Picton Sound, 20.iv.1946, J. Barnard. Inner Chetwode Is., 12.xi.1961, B. A. Holloway. Stephen Island, leafmould, 15.ii.1950, D. Hurley.

**Paramamoea** n.gen.

Small cribellate spiders (body length 2.5-7mm), with the general characteristic of *Mamoea*. Tarsal scopulae reduced or absent but a small scopula present on the disto-ventral surface of metatarsi of legs 3 and 4. Retro-margin of chelicerae with three and promargin with from four-five teeth. Male palp with very strongly developed tibial processes. Embolus stout with a short distal spinous portion. Epigynum large, present as a smooth plate with the external openings on the anterior surface.

*Type species* *Paramamoea incerta* n.sp.

The species described below seem to represent a northern group of species equivalent to the southern species of *Mamoea*. While the general body characteristics are similar, the male palp, the epigynum and internal genitalia are markedly different and justify the grouping of these forms into a separate genus.

**Paramamoea incerta** n.sp.  
Figs. 715-718

MALE

*Measurements*

| Carapace | length 2.21 | width 1.53 |
|----------|-------------|------------|
| Abdomen  | length 2.55 | width 1.53 |

| Leg  | Femur | Patella | Tibia | Metatarsus | Tarsus | Total |
|------|-------|---------|-------|------------|--------|-------|
| 1    | 2.04  | 0.68    | 1.70  | 1.02       | 0.85   | 6.29  |
| 2    | 1.70  | 0.51    | 1.19  | 1.02       | 0.68   | 5.10  |
| 3    | 1.19  | 0.51    | 0.85  | 1.02       | 0.68   | 4.25  |
| 4    | 1.70  | 0.51    | 1.19  | 1.53       | 0.85   | 5.78  |
| Palp | 1.02  | 0.34    | 0.34  |            | 1.02   | 2.72  |

*Colour* Carapace and chelicerae deep reddish brown. Sternum orange brown. Legs orange brown. Abdomen cream with faint band down antero-dorsal surface and from 4 to 5 broad chevrons on posterior half.

*Eyes* Eyegroup occupies half of width of head. From above anterior row straight but posterior row gently recurved. Ratio of AME.ALE.PME.PLE = 10.11.10.11. AME separated from each other by 6/10 and from the ALE by 8/10 of diameter of an AME. Lateral eyes separated by 3/10. PME separated from each other and from the PLE by a distance equal to 11/10. MOQ wider behind than in front in ratio of 31.26 and wider behind than long in ratio of 31.28. Height of clypeus equal to 8/10 of diameter of an AME.

*Chelicerae* Retromargin with three teeth, promargin with five. Teeth on promargin grouped together at the proximal end of furrow at the level of third retromargin tooth.

*Legs* First leg with v.2.2 spines on tibia and v.2.1 on metatarsus. Second leg with v.1.1 on tibia and v.2.2 on metatarsus. Small groups of hairs on the distoventral surfaces of metatarsi of legs 3 and 4 form small scopulae but no distinct scopulae present on tarsi.

*Palp* (Figs. 715, 716) Tibial processes strongly developed. Embolus greatly reduced to form a broad process with a short apical spine.

FEMALE

*Measurements*

Colour Pattern typical.

**Eyes** Ratio of AME.ALE.PME.PLE = 3.4.4.4. AME separated from each other and from ALE by 2/3 of diameter of an AME. PME separated from each other and from PLE by 4/3. MOQ wider behind than in front in ratio of 12.8 and wider behind than long in ratio of 12.10. Height of clypeus 7/3 of diameter of an AME.

**Abdomen** Epigynum and internal genitalia as in Figs. 722, 723.

**Type** Holotype female. North Auckland, Bay of Islands County, Auckland Museum plant/soil sample 172, leaf litter by swamp forest, three miles south of Paihia, 18.xii.1966, K. A. J. Wise (Auckland Museum).

**Records** North Auckland. Same data as type, sample 184. Sample 162, leaf litter by stream, mixed forest east of Waikare, 17.xii.1966, K. A. J. Wise.

#### Huara Forster 1964

1964 *Huara*, Forster. Pac. Ins. Mon. 7: 80.

Small to large (2.5-15mm in body length) ecribellate spiders. Eyegroup occupying most of the width of the head. Two rows. Anterior row straight and posterior row definitely procurved. AME half or less than half width of the ALE. ALE and posterior eyes relatively large and subequal. Lateral eyes well separated. Labium notched at the base and wider than long. Chelicerae with boss. Retromargin with two teeth. Promargin with two or a single tooth. Legs 4123, strongly spined. Trichobothria in a double row on tibiae and a single row on metatarsi and tarsi. Tarsal organ situated behind

the distal trichobothrium. Preening combs not present. Superior claws similar, strongly pectinate. Inferior claw smooth or with no more than two teeth. Claw tufts and tenent hairs absent. Female palp with trichobothria on tibia and tarsus. Claw pectinate. Six spinnerets. Anterior pair stouter than posterior pair but not markedly larger. Colulus distinct, setose. Epigynum with a distinct median distended plate on the posterior margin which is usually oval in shape with the ducts opening anteriorly from a shallow depression. Internal genitalia receptaculate. Ducts not convoluted, contained within the epigynal plate. Tibia of male palp with retrolateral processes. Bulb simple, with embolus, conductor and median epophysis. Embolus originating from the base on the prolateral margin, slender, spiniform, curving along the prolateral margin to rest distally on the conductor. Conductor a prominent T-shaped structure originating from near the base of the embolus. Median apophysis well developed, hooked apically.

Type species *Gohia antarctica* Berland 1931.

This genus is easily recognised by the relatively large eyes and well separated lateral eyes. The presence of trichobothria beyond the tarsal organ is unusual. The most distinctive feature separating this genus from the closely related genera *Rorea* and *Neororea* is the widely separated lateral eyes. These spiders construct weak and rather formless sheetwebs on the ground amongst debris. The egg-sacs are spherical with a thick covering of loose silk, and are guarded by the female spider in the web. *Huara grossa* known only from the Auckland Islands is doubtfully placed in this genus. Large size and heavy pigmentation seems to be characteristic of a number of the subantarctic spiders and it seems wise to leave this species in *Huara* in the meantime.

**Eyes** Area between eyes black. From above anterior row almost straight but from in front anterior row straight and posterior row strongly procurved. Ratio of AME.ALE.PME.PLE = 1.3.4.6. AME separated from each other and ALE by twice their diameter. Laterals widely separated by five times diameter of an AME. PME separated from each other and from PLE by a similar distance. MOQ four times as wide behind as in front.

**Chelicerae** Moderately porrect. Lateral boss well developed. Both margins with two strong teeth.

**Legs** Heavily clothed with fine erect hairs. Tibia of leg 1 with four pairs of ventral spines. Tibia of leg 2 with three pairs.

**Palp** Relatively long but cymbium short. Bulb as in Fig. 749 and tibial processes as in Fig. 750.

## **FEMALE**

Similar to the male. Epigynum and internal genitalia as in Figs. 751, 752.

**Types** Syntype male and females. Auckland Island, March 1923, G. Archey (Canterbury Museum).

**Records** Numerous specimens have been recorded from the Auckland Islands including Rose Is., Ocean Is., Disappointment Is., and Adams Is. Endemic to the Auckland Islands. It shares with the even larger *H. grossa* the distinction of being by far the largest species known for this genus, a characteristic quite commonly found in spiders from these southern islands.

### **Measurements**

|      | Carapace | length  | 7.48  | width      | 4.40   |       |
|------|----------|---------|-------|------------|--------|-------|
|      | Abdomen  | length  | 9.71  | width      | 8.36   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 7.04     | 3.08    | 7.06  | 5.72       | 2.71   | 25.61 |
| 2    | 6.16     | 2.83    | 6.16  | 5.61       | 2.43   | 23.19 |
| 3    | 5.72     | 2.64    | 4.40  | 5.72       | 2.20   | 20.68 |
| 4    | 6.16     | 2.64    | 7.06  | 7.04       | 3.08   | 25.98 |
| Palp | 2.64     | 1.32    | 1.95  |            | 2.64   | 8.55  |

**Colour** Cephalothorax deep reddish brown, eyes surrounded with black. Abdomen yellow-brown, heavily shaded with grey. A few pale markings on antero-median dorsal surface and rather indistinct rows of small pale patches along lateral margins. Chelicerae dark brown, almost black. Legs, palp and sternum uniform reddish brown.

**Carapace** Width of head region only 4/7 width of thorax. Lateral margins almost parallel. Thoracic region widest between the second pair of legs. Fovea long and narrow, not deep.

Figs. 749-752 *Huara antarctica* (Berland). Fig. 749 Ventral view of male palp. Fig. 750 Tibial processes of male palp. Fig. 751 Epigynum. Fig. 752 Internal genitalia.

**Eyes** Eyegroup relatively compact, taking up 5/8 width of head. From above anterior row straight and posterior row recurved. From in front anterior row slightly procurved and posterior row strongly procurved. Eyegroup on a low swelling which projects forward over clypeus. Ratio of AME:ALE:PME:PLE = 7.22:25.25. AME separated by 5/7 and from ALE by 10/7 of diameter of an AME. ALE and PME separated from each other by 8/7 while the PME are separated from each other by 15/7 and from PLE by 10/7. MOQ wider behind than in front in ratio of 65.19 and longer than wide in front in ratio of 54.19.

**Chelicerae** Stout, swollen on proximal anterior surface of basal segment and with a prominent lateral boss. Two strong teeth on each margin and a thick scopula behind promargin. There is a further scopula on the retrolateral surface but more proximal.

**Labium** Slightly longer than wide, notched proximally, lateral margins converging slightly anteriorly. Anterior margin incurved.

**Maxillae** Lateral margins relatively straight but diverging so that distal width is greater. Longer than wide in ratio of 11.7. A thick scopula on inner distal margin with apical hairs longer and forming a tuft.

**Sternum** Longer than wide in ratio of 8.7. Almost oval in outline, indented anteriorly.

**Palp** Spines. Femur, d.1.1.1. Tibia and tarsus, d.2.0.0. p.2.2.2. r.1.1.1.2. Single row of 5 trichobothria on tibia. Claw with single row of five strong teeth.

**Legs** Spines. Leg 1. Femur, d.0.1.1.0. p.0.0.0.2. Tibia, v.2.1.2.2. p.0.0.1.1. Leg 2. Femur, d.2.2.1.0. Tibia, v.2.2.2.0.1. p.0.1.0.1.0. Metatarsus, d.r.0.0.1. v.2.2.2. p.0.1.1. Leg 3. Femur, d.2.2.3. Tibia, d.1.0.1. p.r.0.1.1. v.2.1.2. Metatarsus, d.0.1.1.1. p.r.1.1.1. v.2.2.2. Leg 4. Femur, d.1.1.3. Tibia, d.0.1. p.r.1.1.1. v.2.1.2. Metatarsus, d.1.1.2. p.r.1.1.1. v.2.2.2. Trichobothria. Leg 1. Tibia, 1.1.1. Metatarsus, 8. Tarsus, 6. Legs 2-4. Tibia, 2.2.2.1. Metatarsus and tarsus, 9. Superior claws with 11 long teeth. Inferior claw small, smooth. Disto-ventral surfaces of metatarsi and ventral surfaces of tarsi heavily clothed with hairs, particularly legs 3 and 4. Hairs on distal surface of tarsi make the inferior claw difficult to see.

**Abdomen** Ovoid, closely clothed with small, inconspicuous, adpressed hairs, and fewer, long, erect hairs.

Epigynum as in Fig. 755. Internal genitalia simple as in Fig. 756. Spinnerets short and squat. Colulus distinct, triangular, closely clothed with short hairs.

#### *Huara ovalis* (Hogg) 1909

1909 *Myro ovalis*, Hogg. Subantarct. Is. N. Zeal. 1: 174. 1964 *Myro ovalis*, Forster. Pac. Ins. Mon. 7: 73.

Figs. 757-760

This species was originally established by Hogg for a male and female from Snares Is. which differed markedly

in a number of characters. This discrepancy had been pointed out previously (Forster, 1964) but at that time only the very poorly preserved type material was available. Since that time a further male associated with a typical female from the Snares was examined and figured by one of us but this pair is unavailable at the present time to prepare a detailed description. Drawings of the male palp included below (Figs. 757, 758) establish that this species is correctly placed in *Huara*.

The eyes of the female type are as follows: Ratio of AME:ALE:PME:PLE = 4.11:11.11. AME separated

from each other and from ALE by the diameter of an AME. Lateral eyes separated by a distance equal to 6/4 of this diameter. PME separated from each other by 8/4 and from the PLE by 3/4. MOQ wider behind than in front in ratio of 30.10 and longer than wide in front in ratio of 31.10. Second pair of legs with four pairs of ventral spines on tibia and three pairs on metatarsus.

**Type** Lectotype female, Snares Is. (Otago Museum).

|         |             |            | 0.68   |
|         |             |            | 0.41   |
|         |             |            | Total  |
|         |             |            | 4.74   |
|         |             |            | 4.31   |
|         |             |            | 4.09   |
|         |             |            | 5.14   |
|         |             |            | 1.37   |

**Colour** Carapace pale yellow with darker shading extending back from lateral eyes to posterior margin of carapace. Legs, sternum and chelicerae pale yellow brown. Abdomen cream with scattered small patches of black shading, more widely spaced on dorsal surface.

**Carapace** Width of the head 9/14 of width of thorax. Fovea deep, with outer margins slightly raised.

**Eyes** Eyes ringed with black. Eyegroup large, occupying 3/4 of width of head. From above anterior row straight and posterior row gently procurved. From in front AME level with posterior margins of ALE and posterior row strongly procurved. Ratio of AME.ALE.PME.PLE = 3.11.14.11. AME separated from each other by 3/3 and from ALE by 2/3 of diameter of an AME. Lateral eyes separated by 4/3. PME separated by 7/3 and from the PLE by 2/3. MOQ wider behind than in front in ratio of 35.9 and as long as wide behind. Height of clypeus 11/3 of diameter of an AME.

**Chelicerae** Chelicerae one third of length of carapace. Two teeth on each margin.

**Palp** As shown in Figs. 761, 762.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. Patella, d.1.1. Tibia, v.2.2.0. p.0.1.1. r.0.0.1. d.1.0.1. Metatarsus, v.2.2.0. p.1.1.2. r.0.1.2. d.0.0.1. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.2.2.0. p.0.1.1. r.0.0.2. d.1.0.1. Metatarsus, v.2.2.1. p.1.1.2. r.0.1.2. d.0.1.1. Trichobothria. Tibia, 1.2.1.1.1. Metatarsus, 3. Tarsus, 4. Tarsal organ on mid-surface of tarsi. Superior claws

with eight teeth. Inferior claws with two long teeth. There is a group of bristles on distal quarter of ventral surface of fourth metatarsus.

**Abdomen** Posterior pair of spinnerets as wide as anterior pair but only 2/3 as long. Colulus distinct, evenly curved posteriorly.

## FEMALE

A single female with most of the legs missing appears to belong to this species. Epigynum and internal genitalia as in Figs. 763, 764.

**Types** Holotype male. Canterbury. Goose Bay, 2.vi.1952, R. R. Forster. Allotype female. East of Dozhill, tributary of North Hurunui River, moss in beech forest, 12.v.1952, J. S. Dugdale (Otago Museum).

**Records** Canterbury. Staveley, leaf litter, 2.xi.1970, C.L.W.

|         |             |            | 1.88       |

**Colour** Carapace with broad black patch extending back from eyes to behind the fovea. Legs yellow brown. Abdomen cream. Dorsal surface with pale brown band on the antero-median surface and two pairs of black patches on mid-lateral surfaces of posterior half. Ventral surface with longitudinal black band down each lateral surface.

**Eyes** Eyes ringed with black and enclosed area also dark. Eyegroup occupies the full width of head. From above anterior row straight and posterior row slightly procurved. From in front anterior row straight but posterior row strongly procurved. AME level with posterior margins of ALE. Ratio of AME.ALE.PME.PLE = 5.16.12.12. AME separated by 3/5 and from ALE by 4/5 of diameter of an AME. Lateral eyes separated by twice diameter of an AME. PME separated from each other by 14/5 and from the PLE by 8/5. MOQ wider behind than in front in ratio of 36.13 and longer than wide behind in ratio of 43.36. Height of clypeus 9/5 of diameter of an AME.

**Chelicerae** Boss small. Retromargin with two teeth. Promargin with a single tooth.

**Palp** As in Figs. 769, 770.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. r.0.0.0.1. Patella, d.0.1. Tibia, v.1.2.2.2. p.0.0.0.1. r.0.0.1.1. d.1.0.0.1. Metatarsus, v.2.2.0. p.r.1.1.2. d.0.1.1. Second leg. | Palp    | 0.84     | 0.24    | 0.32       |

**Colour** Type pale and probably recently moulted. Eye region black with broad brown band extending back to near posterior margin of carapace. Legs pale yellow,

darkening distally. Abdomen cream with faint indications of darker shading on dorsal and lateral surfaces.

**Eyes** Eyegroup placed in an oval black area, which extends behind the eyes, and occupies 3/4 of the head. From above anterior row slightly recurved and posterior row straight. From in front anterior row straight and posterior row procurved. Ratio of AME.ALE.PME.PLE = 7.15.12.16. AME separated by 4/7 and from ALE by 3/7 of diameter of an AME. Lateral eyes separated by 2/7. PME separated from each other by 6/7 and from PLE by 4/7. MOQ wider behind than in front in ratio of 30.18 and longer than wide behind in ratio of 39.30. Height of clypeus equal to 8/7 of the diameter of an AME.

**Chelicerae** Length equal to 3/11 of carapace. Retro-margin with two teeth. Promargin with a single tooth.

**Palp** As shown in Figs. 773, 774.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.2. r.0.0.0.1. Patella, d.0.1. Tibia, v.2.2.1. p.1.0.1.1. r.0.0.1.1. d.0.0.0.1. Metatarsus, v.2.2.0. p.1.1.2. r.0.1.2. d.0.1.1. Second leg. **Colour** Carapace pale yellow with two brown bands extending back from lateral eyes to posterior margin. Legs pale yellow with few dark markings. Abdomen cream with black shading on lateral surfaces leaving median area on both dorsal and ventral surfaces pale.

**Eyes** From above and in front anterior row straight and posterior row procurved. AME level with posterior margin of ALE. Ratio of AME.ALE.PME.PLE = 3.10.9.14. AME separated from each other by 3/3 and from the ALE by 2/3 of diameter of an AME. Lateral eyes separated by 7/3. PME separated from each other by 11/3 and from PLE by 3/3. MOQ wider behind than

Figs. 791-792 *Huara dolosa* n.sp. Fig. 791 Epigynum, Fig. 792 Internal genitalia.

in front in ratio of 29.9 and longer than wide behind in ratio of 33.29. Height of clypeus four times diameter of AME.

**Chelicerae** One quarter of length of carapace. Retro-margin with two teeth, promargin with a single tooth.

**Palp** As in Figs. 793, 794.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1.1. Tibia, v.2.1.2.0. p.0.0.1.1. r.d.0.0.0.1. Metatarsus, v.2.2.2.0. p.1.1.2. r.0.1.2. Second leg. Superior claws with from 7-8 teeth. Inferior claw with two teeth.

**Abdomen** Anterior pair of spinnerets contiguous, equal in length to posterior pair. Colulus twice as wide as long, posterior margin evenly curved.

#### FEMALE

Similar to the male. Epigynum and internal genitalia as in Figs. 795, 796.

**Type** Holotype male Westland nr. Ross, in forest, 7.xii.1955, B. J. Marples (Otago Museum). Allotype female. West Inangahua, Fletcher Ck, 200 m, November 1971, leaf litter, J. S. Dugdale (Ent. Divn D.S.I.R.).

**Records** West Inangahua, Colls Ck, xi.1971, J. S. Dugdale. Wallaby Ck, Mawhero State Forest, iv.1971, J. S. Dugdale.

#### *Neororea* n.gen.

Medium sized to large (body length 4.5-8.5mm) cribellate spiders. Eyes in two more or less straight rows. AME much smaller than the PME. Lateral eyes distinctly separated but by less than the diameter of an AME. Chelicerae with boss, both margins with two teeth. Labium notched at the base. Legs without plumose hairs. Tarsal organ distal to the trichobothria. Trichobothria numerous, in a double row on tibia and single row on metatarsus and tarsus. Epigynum with a narrow plate along the posterior margin.

Type species *Chiracanthium sorenseni* Forster 1955.

With *Huara* this genus is related to the cribellate *Neororea*. It may be readily separated from *Huara* by the absence of trichobothria beyond the tarsal organ.

#### *Neororea sorenseni* (Forster) 1955

1955 *Chiracanthium sorenseni*, Forster. Rec. Dom. Mus. 2(4): 179.

p.r.1.1.2. Leg 4. Femur, d.1.1.1.1. p.0.0.1. Tibia, d.1.0.1.0. Metatarsus, d.2.1.2. v.2.2.1. p.r.1.1.1. Trichobothria. Tibia, 2.2.2.2.1. Metatarsus, 7. Tarsus, 5. Superior claws with from 12-14 teeth. Inferior claw with a single tooth.

**Abdomen** Epigynum and internal genitalia as in Figs. 799, 800. Posterior pair of spinnerets more slender than anterior spinnerets and slightly longer. Colulus flat and clothed with fine hairs.

#### MALE

Similar to female. The palp is shown in Fig. 797, 798.

**Types** Holotype male and allotype female.

Auckland Is., Port Ross, under timber, 27 May 1947, J. H. Sorensen (Dominion Museum).

**Records** The majority of the records are from the main Auckland Island but the species has also been recorded from Enderby Island. A single record from Campbell Island (Forster, 1955) would seem to be of a mislabelled specimen as this species has not been collected from this island since and it is unlikely that such a large spider would have been overlooked.

**Neororea homerica** n.sp.

**Colour** Carapace and chelicerae reddish brown. Legs paler reddish brown. Abdomen cream with a broad V shaped dark area on antero-dorsal surface and three pairs of irregular dark patches on mid-lateral surfaces of posterior half of the dorsal surface.

**Carapace** Head region narrow anteriorly where width equals one third of width of thoracic region. Lateral margins straight and diverge strongly to merge with thorax. Fovea narrow but distinct and situated near mid-point of carapace

**Eyes** Each eye ringed with black pigment and area enclosed by the eyes dark. Eyegroup occupies the full width of head. From above anterior row straight and posterior row slightly procurved. From in front both rows appear strongly procurved. Ratio of AME.ALE. PME.PLE = 7.12.14.17. AME separated from each other by 3/7 and from the ALE by 7/7 of diameter of an AME. Lateral eyes separated by 3/7. PME separated from each other by 10/7 and from the PLE by 6/7. MOQ wider behind than in front in ratio of 38.17 and

wider behind than long in ratio of 38.34. Height of clypeus 10/7 of diameter of an AME.

**Sternum** Slightly longer than wide. Anterior margin straight and lateral margins gently undulate. Posterior projection sharp separating coxa 4 by 1/3 of width of a coxa.

**Maxillae** Longer than wide in the ratio of 5.3. Outer margins gently curved. Scopula well developed, extending over 2/3 of anterior surface.

**Labium** Notched at the base. Lateral margins straight and convergent. Anterior margin straight. Wider than long in ratio of 7.5.

**Chelicerae** Short, only 1/4 of length of carapace. Both margins with two teeth.

**Palp** As in Figs. 801, 802.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.0.1. Tibia, v.1.1.2. p.2.2.1. r.1.0.1. Metatarsus, v.2.2.1. p.0.1.2. d.0.1.0. Second leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.0.1. Tibia, v.1.1.2. p.2.2.1. r.0.1.2. Metatarsus, v.2.2.1. p.2.2.2. r.0.2.2. Third leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.0.1.1. r.1.1.1. d.0.0.1. Metatarsus, v.2.2.1. p.r.2.2.2. d.1.0.0. Fourth leg. Femur, d.0.1.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.0.1.1. r.1.1.1. d.0.0.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Trichobothria. Tibia, 2.2.2.1.1. Metatarsus, 4. Tarsus, 5. Superior claws with from 11-13 teeth. Inferior claw with 3 teeth.

**Abdomen** Anterior pair of spinnerets contiguous, larger than posterior pair. Colulus small and clothed with short hairs.

Figs. 801-802 *Neororea homerica* n.sp. Fig. 801 Tibial processes of male palp. Fig. 802 Ventral view of male palp.

**Type** Holotype male. Fiordland. Homer Tunnel, 24.iv.1949, R. R. Forster (Dominion Museum).

**Rorea** n.gen.

Very small (body length 1.5-2mm) cribellate spiders. Eyes in two more or less straight rows. AME very small. Lateral eyes subcontiguous. Chelicerae with boss, retromargin with two and promargin with from 4-5 teeth. Labium notched at the base. Legs without plumose hairs. Tarsal organ distal to the trichobothria. Trichobothria in a double row on the tibia and a single row on the metatarsus and tarsus. Few on metatarsus and tarsus. Epigynum with a small oval plate along the posterior margin.

**Type species** *Rorea aucklandensis* n.sp.

This genus is very closely related to the ecribellate *Neororea* and more distantly to *Huara*. It may be readily separated from *Neororea* by the much smaller size and the more numerous teeth on the promargin of the chelicerae.

**Rorea aucklandensis** n.sp.

**Colour** Cephalothorax and appendages pale yellow. Abdomen heavily shaded with black forming an indistinct chevron pattern on posterior half of dorsal surface.

**Eyes** From in front anterior row straight and posterior row gently procurved. Ratio of AME.ALE.PME.PLE = 1.4.4.4. AME separated from each other and from the ALE by the diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by two and a half and from PLE by twice the diameter of an

Figs. 803-804 *Rorea otagoensis* n.sp. Fig. 803 Tibial processes of male palp. Fig. 804 Ventral view of male palp. Figs. 805-806 *Rorea aucklandensis* n.sp. Fig. 805 Epigynum. Fig. 806 Internal genitalia.

AME. MOQ wider behind than in front in ratio of 21.6 and longer than wide in front in ratio of 18.6. Height of clypeus twice the diameter of an AME.

**Sternum** Scutiform. Longer than wide in ratio of 11.9.

**Labium** Notched at the base. Wider than long in ratio of 11.5.

**Chelicerae** Lateral boss present. Promargin with four, retromargin with two teeth.

**Legs** Superior claws with from 5-6 teeth. Inferior with a single tooth. Tarsal organ at 3/4 of length of tarsus. Spines. First leg. Femur, d.1.1.0. Patella, d.0.1. Tibia, v.2.2.0. Metatarsus, v.2.2.1. Second leg. Femur, d.1.1.0. Patella, d.0.1. Tibia, v.1.1.0. p.0.0.1. Metatarsus, v.2.2.1. Trichobothria similar on all legs. Tibia, 1.2.1.1. Metatarsus, 3. Tarsus, 2. Calamistrum proximal, with seven hairs.

**Abdomen** Cribellum relatively large, twice as wide as long. Posterior margin evenly curved and without median notch. Spinning field large, divided. Anterior pair of spinnerets separated by 2/3 of width of a spinneret. Epigynum in the form of a reniform plate. Internal genitalia as shown in Fig. 805.

**Type** Holotype female. Auckland Island. Hooker Hills, 90-300 m, 11.i.1963, K. A. J. Wise, ex moss *Dicranoloma billardiera* (Ent. Divn D.S.I.R.).

There seems little doubt that this species is closely related to *otagoensis* which is known only from males. Both the male and female genitalia show close affinity with the typical ecribellate species of *Huara* and apart from the presence of cribellum and calamistrum are only separated by their extremely small size and other minor characters.

Metatarsus, v.0.1 and subwhorl of 5, p.1. r.0. Calamistrum lacking. Trichobothria. First leg. Tibia, p.r.1.1. Metatarsus, 2. Tarsus, 2 and tarsal organ. Claws. First leg, superior ten teeth, inferior one tooth. Fourth leg. Superior six teeth, inferior no teeth.

**Abdomen** Cribellum may not be functional.

**Type** Holotype male. Otago. Pitfall trap, Summit Taieri Ridge, Deep Dell-Fillyburn Rd, S43-O33, 14.x.1968, C. L. Wilton (Otago Museum).

**Record** Otago. Pitfall trap, same locality, 26.ix.1968, C.L.W.

#### *Holomamoea* n.gen.

Medium sized (5-5.5mm in body length) ecribellate spiders. Head region of carapace relatively broad and high. Eyegroup occupying two thirds of width of head. Both rows more or less straight. AME and PME subequal, smaller than lateral eyes. Lateral eyes contiguous, placed on a low mound. Sternum as long as wide. Coxae 4 narrowly separated. Chelicerae stout, with boss. Both margins with three teeth. Legs 4123. Strongly spined with three pairs along ventral surfaces of tibiae and metatarsi. Trichobothria numerous, double row on tibia and single row on metatarsus and tarsus. Superior claws similar and strongly pectinate. Inferior claw with two teeth. Scopulae, claw tufts and tenent hairs lacking. Trochanters with shallow notches. Tarsal organ sub-distal. Female palp with trichobothria on both tibia and tarsus. Claw strongly pectinate. Epigynum in the form of a large strongly sclerotized plate with a single anterior opening. Internal genitalia with a pair of receptacula and stout convoluted ducts. Male palp with a long slender embolus, coiled 2½ times around the bulb before resting on the end of the conductor. The conductor in the form of a tube cut longitudinally. Tibia with distal retrolateral process. Median apophysis absent.

Type species *Holomamoea foveata* n.sp.

*Holomamoea* is related to *Huara* from which it is readily separated by the form of the genitalia. The male palp lacks a median apophysis.

The sole known species is restricted to the northern portion of the west coast of the South Island where it is common on the forest floor amongst leaf litter. It does not appear to construct a snare.

| 4   | 1.68     | 0.75    | 1.30        | 1.70  | 0.68       | 0.68   | 6.11  |

**Colour** (Fig. 807) Head region reddish brown, paler medially. A further median brown band extends back from head region to posterior margin. Lateral surfaces of thoracic region yellow. Legs pale yellow brown. Chelicerae reddish brown. Abdomen heavily shaded with blackish brown.

**Carapace** Rather long and narrow. Width of head region 3/4 of width of thoracic region. Fovea short, on posterior slope of thoracic region.

**Eyes** Eyes ringed with black. Eyegroup occupies 2/3 of width of head. Lateral eyes are placed on a low tubercle. From above and from in front both rows appear straight. Ratio of AME.ALE.PME.PLE = 7.11.8.12. AME separated from each other by 8/7 and from the ALE by 15/7 of diameter of an AME. Lateral eyes contiguous. PME separated by 12/7 and from the PLE by 20/7. MOQ wider behind than in front and wider behind than long in ratio of 14.11. Height of clypeus 5/7 of diameter of an AME.

**Sternum** As long as wide. Anterior margin straight and lateral margins evenly curved. Posterior projection sharp and separates coxae 4 by one half of width of coxa.

**Maxillae** Lateral margins straight and parallel but distal portion curved in where the scopula is present. Longer than wide in ratio of 8.3.

**Labium** Notched at the base. Lateral margins straight and convergent and anterior margin straight. Slightly longer than wide.

**Chelicerae** Swollen at base. Boss prominent. Length 1/3 of that of carapace. Both margins with three teeth.

**Palp** As shown in Figs. 808, 809.

**Less** Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.1. Tibia, v.2.2.2. Metatarsus, v.2.2.1. p.r.0.0.1. Second leg. Femur, d.0.1.1.0. Tibia, v.1.2.2. p.0.0.1. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.1. #### Family AMAUROBIIDAE Thorell

Until recently the Amaurobiidae along with the Dictynidae has served as a home for those three-clawed, generalized cribellate spiders which do not show any strongly divergent characters. Lehtinen (1967), having decided that the cribellate state could no longer be used to limit the family, recast the whole concept of this family, and included 71 genera which he divided into nine subfamilies. Of the genera placed in the Amaurobiidae, *Matachia*, *Paramatachia*, *Desis*, *Myro*, *Ommatauxesis*, *Gohia*, *Ixeuticus* and *Gasparia* are transferred by us to the Desidae which we include in the Dictynoidea. These spiders all possess a strongly developed, branched tracheal system. *Stiphidium*, *Cambridgea* and *Corasoides* we place in a new family Stiphidiidae. *Orania* is considered to be a generalized Agelenid while *Amphinecta*, *Maniho*, *Marpesia* and *Huara* are placed in the new family Amphinectidae.

Leech (1972) in his revision of the Nearctic Amaurobiidae follows Lehtinen to some extent in including *Ixeuticus* in the subfamily Desinae within the Amaurobiidae. However while agreeing that the cribellate state need not be diagnostic for the family he did not accept the ecribellate genera listed by Lehtinen.

We consider that the family Amaurobiidae should be limited to those genera which have a simple tracheal system and which possess the variously shaped, but sclerotized, plate-like form of median apophysis. As far as we can ascertain all overseas genera which fall within this definition are cribellate. In New Zealand however, the group is ecribellate except for the single cribellate genus *Waitetola*.

Fig. 814 *Pakeha subsecta* n.sp. female.

Fig. 815 *Otira liana* n.sp. female.

Fig. 816 Australian ecribellate amaurobiid from Blue Mountains, N.S.W. (undescribed genus).

The diagnosis which we have followed is:

Eyes in two rows which are usually transverse but posterior row sometimes definitely curved. Male palp with a flattened, sclerotized median apophysis which may be of various shapes but not the simple hooked form. Embolus basically spiniform but often thickened. Conductor usually relatively small, membranous. Cymbium of male palp with trichobothria. Spination of the basic type. Trichobothria of the legs in a double row on the tibiae and sometimes on the tarsi. A single row on the metatarsi. Three pectinate claws, without claw tufts or scopulae. Plumose hairs absent. Chelicerae with boss, teeth on both margins. Labium notched at base. Internal genitalia strongly receptaculate. Cribellum and calamistrum present or absent. Tracheal system consisting of four simple tubes restricted to the abdomen.

This family is represented in Australia by a number of undescribed species most of which are ecribellate. One of these is of considerable interest in that it possesses a strongly recurved posterior eye row. We have illustrated this genus for comparison with the New Zealand species (Figs. 816, 820-823).

# KEY TO THE NEW ZEALAND GENERA OF THE FAMILY AMAUROBIIDAE

1. Cribellate, with plumose hairs **Waitetela** n.gen.  
Ecribellate and without plumose hairs 2

2. Posterior spinnerets greatly reduced and much smaller than anterior spinnerets 3  
Both anterior and posterior pairs of spinnerets more or less equal in length 6  
3. Retromargin of chelicera with two teeth. Promargin with two normal teeth and a row of minute teeth 4  
Retromargin with four teeth. Promargin without a row of minute teeth 5  
4. Tarsi of all legs with a tarsal organ **Pakeha** n.gen.  
Tarsi of all legs with a tarsal rod **Otira** n.gen.  
5. Six eyes **Auhunga** n.gen.  
Eight eyes **Muritaia** n.gen.  
6. Head region of carapace broad and very high. Eyes normal in size **Paravoca** n.gen.  
Carapace flattened. Eyes relatively small **Mala** n.gen.

Fig. 817 *Pakeha protecta* n.sp. Dorsal view of body.

Fig. 819 Ventral view of male palp of *Amaurobius similis* (Blackwell) (England). Figs. 820-823 Structure of undescribed ecribellate amaurobiid from N.S.W. illustrated in Fig. 816. Fig. 820 Ventral view of male palp. Fig. 821 Tibial processes of male palp. Fig. 822 Epigynum. Fig. 823 Internal genitalia.

# Waitetola n.gen.

Medium sized (body length c. 4.5mm) cribellate spiders. Eight eyes in two more or less straight rows occupying two-thirds of the width of the head. AME only slightly smaller than the rest of the eyes which are subequal. Sternum scutiform, slightly longer than wide. Labium as long as wide and notched at the base. Chelicerae with two teeth on both margins and further teeth along the furrow. Legs moderately long and slender. Plumose hairs present. Trochantera notched. Prolateral spine on the first femur present. Spination of femora d.1.1.1. p.r.0.1. Tibial dorsal spines wanting on the first and second legs but present on the third and fourth. Tibia of the first pair with v.2.2.2. spines but basal and median pairs may be reduced to one or wanting. Distal whorl of metatarsal spines on the first pair of legs with four spines, the dorso-lateral spine on the retro-surface missing. Legs without combs or scopulae. Tarsal organ distal to trichobothria on legs. Palpal tarsus with trichobothria. Trochanter of male palp without twin spines. Embolus distal, short and spiniform. Conductor distal and membranous. Median apophysis a strongly sclerotized plate. Internal genitalia receptaculate. Epigynum without spines. Cribellum divided. Calamistrum proximal.

Type species *Waitetola huttoni* n.sp.

This species, the only cribellate amaurobiid recorded from New Zealand, was collected by Mr Russell Hutton after whom it is named. It is surprising that cribellates of this family are not more abundant in New Zealand as it is evident that the ecribellate genera recorded subsequently in this paper must have been derived from cribellate stock. *Waitetola* does not show any particular relationship to other New Zealand forms nor to genera recorded from other countries.

Nothing is known of the habits of the species described below except that it was found beneath logs on the forest floor.

| Palp | 0.80     | 0.35    | 0.55  |            | 0.95   | 2.65  |

**Colour** Carapace yellow brown with rather broad black bands on lateral margins and one on each side starting at the eyes, traversing the upper slopes and meeting at the fovea on the upper posterior slope. Eyes on black patches. Legs with prominent black bands. Coxae shaded with black distally. Sternum shaded with black. Chelicerae pale orange, maxillae of a similar colour but shaded lightly with black. Labium more heavily shaded than maxillae but each has the typical whitish apex. Abdomen heavily shaded with black, without pattern. Ventral surface of abdomen black, bordered on each side with a series of white spots. There is a pair of sizeable white spots close to and behind the epigastric furrow. Anterior spinnerets black and posterior pair white.

**Carapace** Width of head 7/11 of width of carapace. Hairs on anterior portion, longer among eyes but rest of surface appears glabrous.

**Eyes** Group occupies 2/3 of width of head. From in front anterior row straight and from above posterior row straight. Ratio of AME.ALE.PME.PLE = 5.7.7.7. AME separated by distance equal to 4/5 and from the ALE by 3/4 of diameter of an AME. Laterals separated by 2/5. PME separated from each other by 5/5 and from PLE by 7/5. MOQ wider behind than in front in ratio of 19.14 and as wide behind as long. Height of clypeus equal to 9/5 of diameter of an AME.

**Sternum** Longer than wide in ratio of 22.20. Anterior margin broadly indented. Posterior projection rather long, bluntly pointed and separates posterior coxae by 4/5 of diameter of a coxa.

**Maxillae** Longer than wide in the ratio of 20.13 and longer than labium in ratio of 20.12.

**Labium** As wide as long and notched at base. Sides rounded and distal margin indented.

**Chelicerae** Promargin with a carina and two teeth. Retromargin with two teeth. Within the furrow are three more teeth with median smallest.

**Palp** Spines. Femur, d.1.1.1. p.1. r.0. Patella, 1.1. Tibia, d.1.1. p.1.0. r.0. Trichobothria, Tibia, p.1.1. r.1.1.1. Tarsus, 4 and subdistal tarsal organ. Claw with seven teeth increasing in length distally on basal half.

**Legs** 1423. Trochanters notched. Hairs plumose. Spines relatively weak. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.0.1. Patella, 0. Tibia, v.0.2.2. p.0.1. r.0. d.0. Metatarsus, v.0.2.1. p.0.0.2. r.0.0.1. Second leg. Femur, d.1.1.1. p.r.0.1. Patella, 0. Tibia, v.1.2.2. p.1.1. r.0.1. Metatarsus, v.0.2.1. p.r.0.1.2. Third leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. Tibia, v.1.1.2. p.r.d.1.1. Metatarsus, v.0.2.1. p.r.1.1.2. Fourth leg. Femur, d.1.1.1. p.r.0.1. Patella, 1.1. Tibia, same as third leg. Metatarsus, v.0.1.2.1. p.1.1.2. r.0.1.2 calamistrum 1. Calamistrum occupies about 1/3 of length. Trichobothria, Tibia, p.3. r.5. Metatarsus, 3. Tarsus, 5 and a tarsal organ. Superior claw with seven, inferior claw with two teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 826, 827. Cribellum divided. Spinning areas well separated and rectangular. Distal segment of posterior spinnerets about half length of basal segment and conical.

Similar to female. Bulb and tibial processes of palp as in Figs. 824, 825.

**Types** Holotype female. Hawkes Bay. Waitetola, White Pine Bush, 7.ix.1968, R. W. Hutton. Allotype male. Hawkes Bay. Mahoe, 26.iii.1966, R. W. Hutton (Otago Museum).

# Pakeha n.gen.

Medium sized to small (3.5-7.5mm in body length) ecribellate spiders. Dark shading on carapace broken posteriorly by narrow pale band which extends from fovea to posterior margin. Eyegroup compact usually occupying only one half or less of width of head. Eight eyes in two rows. Anterior row straight, posterior row slightly procurved. AME smallest, remaining eyes subequal. Sternum scutiform, slightly longer than wide. Labium usually as long as wide and notched at the base. Trochantera of posterior pairs of legs with broad shallow indentations. Femur of first pair of legs with or without prolateral spine. Spination of femora usually d.1.1.1. p.r.0.1, spines rather weak and aculeate. Spines on other segments of posterior pairs of legs strong and prominent. Ventral surface of first pair of legs with 2.2.2 or 2.2.0 spination. Dorsal surface of tibiae of first and second pairs each with one basal bristle-like spine but tibiae of third and fourth each with 1.1.1 spines, basal spine erect and aculeate. Distal whorl of spines on metatarsus of first pair reduced to two. Tarsal trichobothria, including those on palp in an alternately staggered double row.

Tarsal organ distal to trichobothria. Distal trichobothrium of metatarsal row long and angularly bent. In addition to metatarsal row there is a trichobothrium posterior to row on distal half of segment. Preening combs are present on metatarsi of second, third and fourth pairs of legs. There are several short teeth on inferior tarsal claw. Superior claws strongly pectinate. Retromargin of cheliceral groove with two even teeth. Promargin often with group of minute teeth in addition to normal teeth. Trochanter of male palp with twin spines, or processes, on distal outer surface. Embolus stout and spiniform. Conductor distal, membranous. Median apophysis a sclerotized plate. Internal genitalia receptaculate. Posterior pair of spinnerets greatly reduced. Colulus small, poorly delineated, with few hairs.

#### MALE

##### Measurements

|      | Carapace | length  | width | width      |        |
|------|----------|---------|-------|------------|--------|
|      | Abdomen  | length  | 2.75  | 1.95       |        |
|      |          | length  | 2.55  | 1.65       |        |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus |
| 1    | 2.50     | 0.95    | 2.55  | 2.50       | 1.30   |
| 2    | 1.95     | 0.95    | 1.60  | 1.80       | 1.00   |
| 3    | 1.60     | 0.80    | 1.10  | 1.60       | 0.75   |
| 4    | 2.20     | 0.90    | 1.65  | 2.15       | 1.00   |
| Palp | 1.10     | 0.40    | 0.40  | 0.80       | 2.70   |

**Colour** Carapace rather strongly shaded. Cervical bands continue past the fovea on each side to posterior margin. Legs conspicuously banded. Sternum heavily shaded with irregularly shaped pale area mid anteriorly. Abdomen with a brown tinge anteriorly. Black markings tend to make a pattern on anterior surface and posterior slope rather pale.

Figs. 832-836 *Pakeha minima* n.sp. Fig. 832 Ventral view of male palp. Fig. 833 Tibial processes of male palp. Fig. 834 Epigynum. Fig. 835 Epigynum with plug. Fig. 836 Internal genitalia.

**Eyes** Group occupies half width of head. Ratio of AME.ALE.PME.PLE = 3.5.5.5. AME separated from each other by 1/3 of diameter of an AME and twice that distance from ALE. PME separated from each other and from PLE by diameter of an AME. MOQ wider behind than in front in ratio of 13.7 and wider behind than long in ratio of 13.12. Height of clypeus equal to 9/3 of diameter of an AME.

**Sternum, maxillae, labium and chelicerae** are typical.

**Palp** Tibial processes and bulb as in Figs. 832, 833.

**Legs** 1423. Spines. First leg. Femur, prolateral spine present, d.1.1.0. p.0.1. r.0. Tibia, v.2.2.2. p.r.0. Metatarsus, v.2.2.0. p.r.0.0.1. Second leg. Femur, d.1.1.0. p.0.1. r.0. Tibia, v.2.2.2. p.0.1.1. r.0. Metatarsus, v.2.2.1. p.1.2.2. r.0.0.1.

**Colour** Carapace and legs pale orange brown. Abdomen pale brown with few small dark brown markings.

**Eyes** Eyegroup occupies one half of width of head. From above anterior row straight and posterior row procurved. From in front anterior row gently procurved and posterior row strongly procurved. Ratio of AME. ALE.PME.PLE = 5.10.10.11. AME separated by 6/5 and from ALE by 5/5 of diameter of an AME. Lateral eyes separated by 4/5. PME separated from each other by 14/5 and from PLE by 10/5. MOQ wider behind than in front in ratio of 17.8 and wider behind than long in ratio of 17.14. Height of clypeus 9/5 of diameter of an AME.

**Chelicerae** Length 3/7 of carapace. Retromargin with two teeth. Promargin with six minute teeth followed by two normal teeth and a carina which extends to base of chelicera.

**Palp** Spines. Femur, d.0.1.1.0. p.0.0.0.2. Patella, d.1.1. Tibia, p.r.1.0. Trichobothria. Tibia, 2.2.2.2. Tarsus, 1.2.2.1. Claw with seven teeth.

**Legs** Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.2. Tibia, v.2.2.1. p.1.0.0. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.0. p.0.0.0.1. Patella, d.1.1. Tibia, v.1.2.1. p.0.0.1. Metatarsus, v.2.2.1. p.0.1.2. r.0.0.1. Metatarsal comb on legs 2-4 with six, eight and seven bristles respectively. Trichobothria. Tibia, 2.2.1.2.1. Metatarsus, 3. Tarsus, 5. Superior claws with nine teeth. Inferior claw with single small tooth.

**Abdomen** Epigynum and internal genitalia as in Figs. 851, 852. Colulus small, with three hairs.

#### MALE

Similar to female. Palp as in Figs. 849, 850.

| 4    | 3.96          | 1.55        | 3.52       | 3.96       | 1.76   | 14.75 |
| Palp | 1.99          | 0.67        | 1.24       |            | 1.36   | 5.26  |

**Colour** Cephalothorax, legs and palp, pale, reddish brown. Abdomen pale grey with broken white markings down entire mid-dorsal surface and a further white area down mid ventral surface.

**Eyes** Eyegroup compact, occupying less than 1/2 width of head. From above and in front posterior row strongly procurved and anterior more gently procurved. Ratio of AME.ALE.PME.PLE = 5.9.9.8. AME separated from each other by 2/5 and from ALE by 4/5 of diameter of an AME. Lateral eyes subcontiguous. PME separated by 8/5 and from PLE by 7/5. MOQ wider behind than in front in ratio of 13.6 and longer than wide in front in ratio of 11.6. Width of clypeus slightly more than twice diameter of an AME.

**Sternum** Slightly longer than wide. Anterior and lateral margins almost straight, sloping sharply in from coxae 2 to form a sharp point posteriorly between coxae 4. Coxae 4 separated by 1/4 width of coxae.

**Labium** Notched at base, as wide as long, lateral margins straight, anterior margin gently incurved.

**Maxillae** Longer than wide in ratio of 3.2.

**Chelicerae** Two strong teeth on both margins.

**Legs** 4132. Spines. First leg. Femur, d.1.1. p.2 distal. Tibia, v.2.1. p.2. Metatarsus, v.2.2.2.2. Second leg. Femur, d.1.1.1. p.0.0.1.1. Tibia, v.2.2.2. p.0.1.1. Metatarsus,

v.2.2.2.2. p.1.1.2. Third leg. Femur, d.1.1.2.1. Tibia, d.p.r.1.1.1. v.2.2.2. Metatarsus, d.0. v.p.r.2.2.2. Fourth leg. Femur, d.1.1.2.1. Tibia, d.p.r.1.1.1. v.2.1.2. Metatarsus, d.0. v.p.r.2.2.2. Trichobothria in a double row on tibia and single row on metatarsi and tarsi of all legs. Superior claws homogeneous with from 6-7 long teeth. Inferior claw with single tooth.

**Abdomen** Epigynum as in Fig. 865, and internal genitalia as in Fig. 866.

#### MALE

Similar to the female. The palp is shown in Figs. 863, 864.

**Type** Snares Is., Otago Museum (subadult female).

**Records** Snares Is. Near Station Point, under *Olearia* logs, 22-28.i.1961, I. Mannering. Near Station Point, sweeping *Polystichum vestitum*, 7.ii.1961, I. Mannering. Penguin Colony, under log in bush near colony, 28.i.1961, I. Mannering.

The association of the male and female specimens on which Hogg based his description of *Myro ovalis* (= *Huara ovalis*) was queried earlier (Forster, 1964) and the discovery of the true male of *ovalis* has cleared up this point. It is now clear that the male described by Hogg should be associated with *kirki*.

**Colour** Cephalothorax and legs dark reddish brown. Abdomen heavily shaded with blackish brown.

**Eyes** Eyegroup compact and occupies one half of width of head. From above anterior row straight and posterior row procurved. From in front both rows procurved. Ratio of AME.ALE.PME.PLE = 3.8.8.10. AME separated from each other by 4/3 and from the ALE by 2/3 of diameter of an AME. Lateral eyes separated by distance equal to diameter of an AME. PME separated from each other by 8/4 and from PLE by 4/4. MOQ wider behind than in front in ratio of 24.10 and wider behind than long in ratio of 24.21. Height of clypeus equal to 5/3 of diameter of an AME.

**Chelicerae** Retromargin with two teeth. Promargin with five minute teeth followed by two normal teeth and a carina which extends to base of chelicera.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.1.0. d.1.1. Trichobothria. Tibia, 1.1.2.1. Tarsus, 1.1.1. Tarsal organ sub-distal. Claw with five teeth.

Fourth leg. Tibia, 3.2.1.2.1.2. Metatarsus, 5. Tarsus, 1.1.2.1. Superior claws with eight teeth. Inferior claw with two small teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 886, 887. Colulus well developed, with six hairs.

**Types** Holotype female. Fiordland. Manapouri, moss, 23.i.1951, R. R. Forster (Otago Museum).

#### *Otira* n.gen.

Relatively small (3-3.5mm in body length) ecribellate spiders closely resembling the small species of *Pakeha*

Figs. 889-892 *Otira satara* n.sp. Fig. 889 Ventral view of male palp. Fig. 890 Tibial processes of male palp. Fig. 891 Epigynum. Fig. 892 Internal genitalia.

(e.g. *parvoti*, *pula*) but differing mainly in having a 'tarsal rod' in place of the pedal tarsal organ. Male palp with a strong, and often complex, median tegular process and prominent median apophysis. Epigynum without spines. Both rows of eyes strongly procurved when viewed from above.

Type species *Otira satara* n.sp.

These small spiders, which have only been recorded from the northern portion of the west coast of the South Island and the Wellington region of the North Island, live on the forest floor amongst leaf litter. Nothing is known of their habits or of the function of the tarsal rod, which seems to have replaced the tarsal organ.

| Palp | 0.48     | 0.14    | 0.16  |            | 0.48   | 1.26  |

**Colour** Carapace and chelicerae pale orange brown. Legs yellow with faint bands. Abdomen pale yellow brown with black markings which form an indistinct chevron pattern on postero-dorsal surface.

**Carapace** Head narrow, width 6/17 of thoracic region. Lateral margins of head divergent, merging with thoracic region. Fovea distinct.

**Eyes** Eyegroup compact but as head is narrow occupies 3/4 of width. From above anterior row straight and posterior row strongly procurved. From in front both rows procurved. Ratio of AME.ALE.PME.PLE = 4.7.8.8. AME separated from each other by 2/4 and from the ALE by 1/4 of diameter of an AME. Lateral eyes subcontiguous. PME separated by 5/4 and from PLE by 4/4. MOQ wider behind than in front in ratio of 21.10 and as wide behind as long. Height of clypeus 11/4 of diameter of an AME.

**Sternum** Anterior margin straight and lateral margins evenly curved. Coxae 4 separated by one third of width of a coxa.

**Maxillae** Lateral margins straight and parallel. Longer than wide in the ratio of 9.7.

**Labium** Notched at base. Lateral margins straight and convergent. Anterior margin straight. Wider than long in ratio of 11.10.

**Chelicerae** Length equal to 3/8 of carapace. Retro-margin with two teeth. Promargin with four minute teeth followed by two normal teeth and a carina which extends to base of chelicera.

**Palp** As shown in Figs. 889, 890.

**Legs** Each tarsus with a tarsal rod. Spines. First leg. Femur, d.0.1.1.0. p.0.0.0.1. Tibia, v.2.2.2. p.0.0.1. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. | Palp | 0.63     | 0.30        | 0.38       |            | 0.63   | 1.94  |

*Colour* Head region yellow brown and thoracic region orange-brown. Legs and chelicerae orange brown. Abdomen heavily shaded with greyish black reticulate markings.

*Eyes* Eyegroup occupies one half of width of head. From above and front in front both rows appear procurved. Ratio of AME.ALE.PME.PLE = 5.10.10.11. AME separated from each other by 2/5 and from the ALE by 1/5 of diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 5/5 and from the PLE by 1/5. MOQ wider behind than in front in ratio of 25.12 and wider behind than long in ratio of 25.24. Height of clypeus equal to diameter of an AME.

*Chelicerae* Length equal to 1/3 of carapace. Both margins with two teeth. Lateral boss present.

*Palp* Spines. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, p.1.0. d.1.1. Tarsus with three trichobothria arranged 2.1. Claw with five small teeth.

*Legs* Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia and metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. Patella, d.1.1. Tibia, v.1.1.2. p.0.1.1. Metatarsus, v.2.2.1. p.0.1.1. Metatarsal comb on legs 2-4 consisting of seven bristles on legs 2 and 3, and six bristles of leg 4. Trichobothria. First leg. Tibia, 1.1.1.2.1.1. Metatarsus, 1.2.1.1. Tarsus, 1.2.1.1. Fourth leg. Tibia, 1.1.1.2.1.1. Metatarsus, 1.1.1.2.1.1. Tarsus, 1.1.2.1. Superior claws with eight teeth. Inferior claw with a single small tooth.

*Abdomen* Epigynum and internal genitalia are shown in Figs. 904-905. Colulus well developed.

#### MALE

Similar to female. Palp as in Figs. 900, 901.

*Types* Holotype female. Wellington. Rimutaka District, 5.xi.1946, J. T. Salmon (Dominion Museum). Allotype male. Bush near Holdsworth Lodge, pitfall, 15.viii.1972, C. L. Wilton (Otago Museum).

*Records* Wellington. Days Bay, leafmould, 7.v.1946, R.R.F. Wainuiomata Reserve, leafmould, 7.viii.1969, R. Ordish. Mt Holdsworth, near motor camp, Tararua Forest Park, leaf litter, 3.viii.1966, C.L.W.

*Eyes* Ratio of AME.ALE.PME.PLE = 2.4.5.5. AME separated from each other and from ALE by one half of width of an AME. Laterals contiguous. PME separated from each other by a distance equal to and from the PLE by one half of diameter of an AME. MOQ wider behind than in front in ratio of 12.5 and longer than wide in front in ratio of 11.5.

*Chelicerae* Two teeth on both margins.

*Legs* Legs 1 and 2 with similar spination. Femur, d.1.1.0. Tibia, v.1.1.0. Metatarsus, v.2.2.2.

**Abdomen** Epigynum and internal genitalia as in Figs. 908, 909.

**Type** Holotype female. Canaan, Nelson, 25.x.-1948, C.L.W. (Otago Museum).

#### *Auhunga* n.gen.

Small (body length c.2.5mm) cribellate spiders. Six fairly large eyes in a compact ring, occupying less than one half of width of head. Posterior row gently procurved. Legs, including spination, similar to *Pakeha*. Sternum scutiform, slightly longer than wide. Labium slightly wider than long and notched at the base. Epigynum of *Pakeha* type but more compact. Lateral spines well developed. Internal genitalia receptaculate. Male palp with a massive embolus and heavily sclerotized median apophysis. Conductor probably absent. Posterior spinnerets small.

Type species *Auhunga pectinata* n.sp.

The sole species has been found in leaf litter in beech forest. Nothing is known of its habits.

#### *Auhunga pectinata* n.sp.

### Muritaia n.gen.

Small ecribellate spiders (body length 2.5-3.5mm) resembling the small species of *Pakeha* but with four small teeth on the retromargin of the cheliceral groove in place of the two larger teeth found in *Pakeha*. Inferior tarsal claw smooth or with one small tooth. Embolus spiniform and relatively long, twisted distally. There appears no conductor present in the species known from a male. No tegular apophysis.

Type species *Muritaia suba* n.sp.

**Colour** Cephalothorax and legs uniform orange brown. Abdomen pale yellow brown.

**Eyes** Eyegroup compact and occupies one half of width of head. From above anterior row straight and posterior row slightly procurved. From in front AME level with posterior margin of ALE and posterior row strongly procurved. Ratio of AME.ALE.PME.PLE = 2.7.6.6. AME separated from each other by 2/2 and from the ALE by 1/2 of diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 5/2 and from PLE by 2/2. MOQ wider behind than in front in ratio of 17.6 and wider behind than long in ratio of 17.12. Height of clypeus four times diameter of an AME.

**Chelicerae** Retromargin with four closely spaced small teeth. Promargin with three larger teeth of which median is largest.

**Palp** Spines. Femur, d.0.1.1.1. Patella, d.1.1.1. Tibia, p.1.0. d.1.1. Trichobothria. Tibia, 1.2.1.1. Tarsus, 1.1.1. Claw with five teeth.

**Legs** Spines. First leg. Femur, d.0.1.1.0. Tibia, v.2.1.2.1. Metatarsus, v.2.2.2. Second leg. Femur, d.0.1.1.1. Patella, d.1.1. Tibia, v.p.0.1.0. Metatarsus v.2.2.1 p.0.1.2. r.0.0.1. Metatarsal comb on legs 2-4. Five bristles on leg 2 and ten on legs 3 and 4. Trichobothria. First leg. Tibia, 2.2.2.1. Metatarsus and tarsus, 3. Fourth leg. Tibia, Tibia, 2.1.1.2.1. Metatarsus, 4. Tarsus, 3. Superior claws with seven teeth. Inferior claw with a single tooth.

**Abdomen** Epigynum and internal genitalia as in Figs. 922, 923.

**Type** Holotype female. Canterbury. Kelseys Bush, Waimate, leafmould, 30.iii.1948, W. J. Paul (Otago Museum).

Fig. 938 Internal genitalia (Waipori Gorge). Fig. 939 Internal genitalia (Manapouri). Fig. 940 Internal genitalia (Catlin).

**Abdomen** There is a small conical colulus between the anterior spinnerets which are narrowly separated. Posterior spinnerets only half length and diameter of anterior spinnerets. Epigynum and internal genitalia as in Figs. 928, 929.

**Type** Holotype female. Auckland. Whakatane County, forest east of Lake Rotorua, Auckland Museum, sample 66, leaf litter, 5.x.1966, K. A. J. Wise (Auckland Museum).

#### *Paravoca* n.gen.

Medium sized (5-6.5mm in body length) cribellate spiders. Head region broad and raised (Fig. 931). Eyegroup compact, occupying one half of width of head. Two more or less straight rows. AME smallest, remaining eyes subequal. Labium as long as wide and notched at the base. Chelicerae swollen on the antero-proximal surface. Promargin with two and retromargin with three teeth. Trochantera not notched. Prolateral spine lacking on femur of first pair of legs. Femoral spination usually d.1.1.0. p.0.1. r.0. Ventral surface of tibia of first pair with 2.2.2 spines, one pair distal in position. Dorsal

surface of tibiae of third and fourth pairs with 1.1 spines and those of first and second with basal bristle only. Distal whorl of spines on metatarsi of first and second pairs with four spines, dorso-lateral spine on posterior surface missing. Metatarsi without combs or scopulae. Distal trichobothrium of metatarsal row long and angularly bent. Tarsal organ distal to trichobothria on legs. Palpal tarsus with trichobothria. Trochantera of male palp without twin spines. Tibia short and strongly modified. Embolus stout, conductor distal, membranous. Median apophysis sclerotized. Internal genitalia receptaculate. Colulus large, flattened and evenly clothed with hairs. Posterior spinnerets shorter than anterior pair.

Type species *Paravoca otagoensis* n.sp.

|      |          |             |            | 1.50       |

**Colour** (Fig. 930) Carapace and chelicerae reddish brown. Maxillary lobes reddish brown with conspicuous white area where scopulae situated. Legs yellow brown. Abdomen pale brown with reddish brown shading on lateral surfaces and with a mid dorsal band which forms three chevrons on posterior half of abdomen.

**Carapace** As shown in Fig. 931. Head high and broad.

**Eyes** Group occupies slightly more than half width of head. From above both rows straight and from in front anterior row slightly procurved. Ratio of AME.ALE. PME.PLE = 4.7.6.7. AME separated from each other and from ALE by 3/4 of diameter of an AME. PME separated from each other by 5/4 and from PLE by 6/4. MOQ wider behind than in front in ratio of 17.11 and wider behind than long in ratio of 17.14. Height of clypeus 13/4 of diameter of an AME.

**Sternum** Scutate, margins sinuate. Posterior projection tapers to a moderate point between posterior coxae which are separated by less than half of diameter of a coxa.

**Chelicerae** Fang moderately long. Promargin of groove with two teeth and retromargin with three teeth.

**Palp** Bulb and tibial processes as in Figs. 932-934.

**Legs** Spines short. First leg. Femur, prolateral spine lacking, d.1.1.0. r.0.1. Tibia, v.2.2.2. p.0.1.1. r.0. Metatarsus v.2.2.1. p.0.1.2. r.0.0.1. Third and fourth pairs of legs with tibial dorsal spines. The distal trichobothrium on metatarsus long and bent. Tarsal organ distal to trichobothria on tarsi. Inferior claw has three or four straight teeth increasing in size distally.

|      |          |             |            | 3.58       |

**Colour** Carapace yellow brown with dark reddish brown band extending from each anterior corner of head to fovea. These bands continue back as single band to merge posteriorly with further pair of bands which extend back down lateral margin of thoracic region. Chelicerae dark reddish brown. Legs yellow brown with conspicuous bands of reddish brown. Abdomen cream with four prominent chevrons down dorsal surface which merge with longitudinal band down each lateral margin. Maxillae dark reddish brown but scopulate area white.

**Carapace** Head region broad and high. Width 10/13 of the thoracic region. Fovea relatively long, with outer margins slightly swollen.

**Eyes** Eyegroup occupies one half of width of head and placed on a slightly raised area which overhangs clypeus. From above both rows straight but from in front posterior row slightly procurved. Ratio of AME.ALE.PME. PLE = 8.16.15.15. AME separated from each other by 7/8 and from ALE by 10/8 diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 14/8 and from PLE by 16/8. MOQ wider behind than in front in ratio of 44.23 and wider behind than long in ratio of 44.35. Height of clypeus three times diameter of an AME.

**Sternum** Anterior margin straight and lateral margin slightly undulate. Posterior projection short and separates coxae 4 by 7/8 of width of a coxa.

**Maxillae** The segments curve over labium where there is a thick scopula. Twice as long as wide.

**Labium** Notched at base. Lateral margins straight and convergent. Anterior margin straight. As long as wide.

**Chelicerae** Strong, 9/17 of length of carapace. Proximal surface swollen. Retromargin with three teeth. Promargin with two teeth and strong carina which extends to base of chelicera.

**Palp** As in Figs. 941, 942.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.0.1. Tibia, v.2.2.2. p.1.1.1. Metatarsus, v.2.1.2. p.d.0.1.1. r.0.0.1. Second leg. Femur, d.0.1.1.1. p.0.0.0.1. #### *Mala* n.gen.

Large ecribellate spiders, heavily clothed with fine ciliate hairs. Carapace low, head region clearly defined. Eight eyes in two rows occupying little more than one half of width of head region. Eyes reduced in size and without pigment. Both rows definitely procurved. Lateral eyes well separated. Chelicerae stout, vertical, with teeth on both margins. Lateral condyles present. Promargin with thick scopula. Legs 4132 thickly clothed with ciliate

hairs but without scopulae, claw tufts or tenent hairs. Strongly spined, with spines on ventral surface of some tarsi. Trochanters notched. Trichobothria very long and numerous, in a double row on tibiae and a single row on metatarsi and tarsi. Three claws, superior pair similar, strongly pectinate. Inferior smooth. Tarsal organ not present. Palp strongly spined, with double row of trichobothria on tibia and a single row on tarsus. Claw strongly pectinate. Tarsal organ not present. Epigynum well developed with a pair of marginal teeth. Internal genitalia simple consisting of a pair of spherical receptacula. Six spinnerets. Anterior pair stout, almost contiguous. Distal segment short. Posterior pair stout, with a short distal segment. Colulus small, setose. Tracheal system not known but with small medium spiracle near the spinnerets. Male not known.

Type species *Mala cavernicola* n.sp.

This genus is represented by the cave dwelling species described below. Some of the distinctive characters used in the generic definition are undoubtedly adaptations, such as the reduced eyes and the long trichobothria, which would not necessarily be present in surface dwelling representatives. Taking these characters into account we are still not able to suggest direct relationship with other elements of the New Zealand fauna. The absence of a tarsal organ is unusual. The discovery of a male would be of some assistance in placing this genus. It is possible that relationship will be found with some of the two clawed cursorial spiders. The habits of this spider are not known but it is thought that it is a hunting spider which does not construct a snare.

| Palp | 2.75  | 1.00    | 2.25  |            | 2.25   | 8.25  |

**Colour** Carapace and legs uniform pale yellow. Abdomen cream.

**Carapace** Heavily clothed with adpressed hairs. Head region wide (Fig. 945) and clearly delineated. Both head and thoracic regions flattened.

**Eyes** (Fig. 945) Eyes very small and without pigment. Group occupies 5/9 of width of head. Both rows definitely procurved. Ratio of AME.ALE.PME.PLE = 2.5.4.5. AME separated from each other by 5/2 and from the ALE by 7/2 of diameter of AME. Lateral eyes separated by 9/2. PME separated from each other and PLE by 13/2. MOQ longer than wide in front in ratio of 4.3 and wider behind than in front in ratio of 7.3. Height of clypeus 3½ times diameter of an AME.

**Sternum** Scutiform. Longer than wide in the ratio of 7.6. Pointed behind in front of coxae 4 which are only slightly separated.

**Maxillae** Parallel. Longer than wide in ratio of 15.8. pointed distally. There is a thick scopula along the inner distal margin.

**Labium** Notched at base. Lateral margins straight and parallel. Anterior margin straight. Longer than wide in ratio of 8.7.

**Chelicerae** Vertical. Relatively short but stout. Antero-proximal surface swollen (Fig. 947). Lateral condyles

well developed. Promargin with two teeth at proximal end of furrow. Retromargin with four even teeth. Thick scopula present along promargin.

**Legs** 4231. Heavily clothed with fine ciliate hairs. Trochanters notched. Tarsal organ absent. Superior claws of legs 1 and 2 with 14-15 teeth, legs 3 and 4 with six teeth (Figs. 946, 947). Inferior claw smooth. Spines. Leg 1. Femur, d.r.0.1.1.1. p.0.0.1.1. Tibia, v.2.2.2. p.r.1.1.1. Metatarsus, v.2.2.1. p.r.1.1.1. Leg 2. Femur, d.1.1.0.1. p.0.1.0.1. r.0.1.1.1. Patella, d.0.1. Tibia, v.2.2.2. p.r.1.1.1. Metatarsus, v.2.2.1. p.0.1.1. r.1.1.2. Tarsus, v.1 at 2/3. Leg 3. Femur, d.r.1.1.1. p.1.0.1. Patella, d.1.1. Tibia, v.2.2.2. p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.1. Tarsus, v.1 at 2/3. Leg 4. Femur, d.r.1.1.1. p.1.1.1.1. Patella, d.1.1. Tibia, v.2.2.2. p.r.1.1.1. d.1.0.1. Metatarsus, v.2.2.1. p.r.d.1.1.2. Tarsus, v.1.1, one spine at 2/3 and second subdistal. Trichobothria. Tibiae 2.2.1.1.1. Metatarsi 1.1.1. Tarsi from 7-9 in single row. Trichobothria extremely long and slender.

**Palp** Claw with eight even sized teeth. Tarsal organ lacking. Spines. Femur, d.1.1.1. p.r.1 distal. Patella, d.1.1. Tibia, d.0.1.1. p.0.1.0. r.1.1.0. v.1.0.0. Tarsus, heavily spined. Trichobothria. Tibia, 1.2.2.1. Tarsus with nine long trichobothria

**Abdomen** Closely clothed with ciliate setae. Colulus small, with numerous hairs. Epigynum and internal genitalia as in Figs. 945, 946.

**Type** Holotype female. Nelson. United Creek Cave, 70 feet from entrance, August 1960, P. R. Kettle (Entomology Division, D.S.I.R.).

**Remarks** This is the second spider recorded from New Zealand showing strong adaptations

Figs. 945-949 *Mala cavernicola* n.sp. Fig. 945 Epigynum. Fig. 946 Internal genitalia. Fig. 947 Front of carapace showing eyes. Fig. 948 Claws of second pair of legs showing ventral spines on tarsus. Fig. 949 Claws of fourth pair of legs.

to cave life. The lack of pigment, reduction of the eyes and length of the trichobothria indicate considerable specialization. The other cave spider, as yet not described, belongs to the family Gradungulidae (Spiders of New Zealand, Part 1, p. 60) and is also found in caves in the Nelson area. The harvestmen recorded from same caves in the Nelson area (Forster, 1965) are also endemic and show considerable modification.

#### Family NEOLANIDAE n.fam.

Eyes in two more or less straight rows which occupy more than a half of width of head. Anterior and posterior median eyes equal in size or nearly so. Lateral eyes only slightly larger. Sole genus known cribellate, with calamistrum hairs in a single row and cribellum divided. Legs with basic spination. Plumose hairs absent. Trichobothria in a double row on the tibia and a single row on the metatarsi and tarsi. Trichobothria not present on tarsi of the female palp or cymbium of male palp. Three pectinate claws. No claw tufts, tenent hairs or scopulae. Trochanters weakly notched. Sternum of basic shield shape. Labium notched at base. Chelicerae with lateral bosses, with two retromarginal and three promarginal teeth. Male palp with tibial processes. Bulb with a slender, curved embolus and median raised process which functions as conductor. Epigynum simple with a large pair of receptacula and short ducts, opening anteriorly. Spinnerets normal with anterior and posterior of equal length. Tracheal system consisting of four simple tubes opening from near the spinnerets.

Snare of the single known genus relatively small sheet web guyed up from the substrate where the spider rests. Webs usually constructed on trunks of trees.

Type genus *Neolana* n.gen.

This family retains most of the generalized features of the Dictynoid-Amaurobioid group of families. These are the more or less equal sized eyes in two rows; chelicerae with a lateral boss, two retromarginal and three promarginal teeth; legs with basic spination, three claws and lacking such modifications as claw tufts and scopulae. The simple tracheal system indicates that it belongs within the Amaurobioidea. The form of the male palp along with the absence of trichobothria on the cymbium precludes the association of *Neolana* with the other families of the Amaurobioidea. Amongst cribellate spiders the bulb of the male palp is similar to that found in the Dinopidae.

#### *Neolana* n.gen.

1959 *Ixeuticus* (part), Marples. Trans. Roy. Soc. N. Zeal. 87(3, 4): 347.

Medium sized (body length 6-9mm) cribellate spiders. Eyes in two more or less straight rows occupying more than one half of width of head. AME only slightly smaller than remaining eyes and sometimes same size as PME. Laterals contiguous. Sternum scutiform, slightly longer than wide. Labium notched at base. Chelicerae with definite lateral boss. Retromargin with two, promargin with three teeth. Legs strongly spined, without plumose hairs. Trichobothria numerous with basic distribution, double row on tibiae and a single row on metatarsi and tarsi. Superior claws strongly pectinate, inferior claw with few teeth. Tarsal organ present. Trochanters weakly notched. Calamistrum well developed, proximal, occupying almost one half of the length of the segment. Cribellum divided. Cymbium of male palp narrowed distally and extending well beyond the bulb

Fig. 950 *Neolana dalmasi* (Marples) female.

Fig. 951 Snare of *Neolana dalmasi* (Marples) on tree trunk.

but without trichobothria. Embolus originating from the anterior retrolateral surface, directed across the bulb before curving forward. Distal portion bent. There is a membranous portion fused with proximal half of embolus. Tip of embolus rests on a median lobe. A tubercle on the posterior half of the tegulum may be the vestige of the median apophysis but is more likely to be a secondary lobe or functional conductor. Epigynum simple, without spines. Internal genitalia receptaculate, with short convoluted ducts opening anteriorly. The snare consists of a dense sheetweb, usually constructed on tree trunks, guyed so as to leave a space below where the spider rests on the bark.

Type species *Ixeuticus dalmasi* Marples 1959.

The bulb of the male palp is a type not yet encountered in the New Zealand families treated so far in this revision. In many ways it resembles the form characteristic of the cribellate family Dinopidae.

| Palp | 0.90  | 0.36    | 0.66  |            | 1.02   | 2.94  |

**Colour** (Fig. 948) Carapace yellow brown darkening anteriorly and around margins. Eyes surrounded with black. Legs pale brown with faint bands. Antero-dorsal surface of abdomen with three pairs of large dark patches beside a central pale band, and with from 5-6 transverse black bands posteriorly.

**Eyes** Eyegroup occupies 4/5 of width of head. From above anterior row slightly recurved and posterior row procurved. Ratio of AME:ALE:PME:PLE = 11:15:11:15. AME separated from each other by 6/11 and from ALE by 9/11 of diameter of an AME. Lateral eyes sub-contiguous. PME separated from each other and from PLE by 12/11. MOQ wider behind than in front in ratio of 34.27 and longer than wide behind in ratio of 37.34. Height of clypeus equal to diameter of an AME.

**Sternum** Scutiform, longer than wide in ratio of 6.5. Anterior margin broadly incurved, lateral margins evenly curved. Posterior projection blunt, separating coxae 4 by a distance equal to half of width of a coxa.

**Maxillae** Twice as long as wide at the base. Lateral margins parallel, straight, anterior margin gently rounded.

**Labium** Notched at the base. Lateral margins slightly convergent, anterior margin straight. Wider at the base than long in ratio of 4.3.

Fig. 952 *Neolana dalmasi* (Marples). Lateral view of carapace and chelicerae.

**Colour** Carapace pale cream but becoming pale orange on anterior half of head. Slight shading of black on upper slopes but not on mid-dorsal region which is almost white. Eyes on black spots. Chelicerae pale orange brown with a mottled or streaky appearance. Legs pale, tinged with pale orange. Bands are not distinct but may occur faintly on posterior pairs. Sternum cream, darker at margins and whole surface stippled with black. Maxillae orange brown and labium darker brown with distal margin white. Dorsal surface of abdomen very pale with only longitudinal bands followed by several pairs of spots showing. Lateral and posterior slopes shaded with black. Ventral surface pale with some dark shading. Plates covering booklungs rich brown and sclerotized, a character which may be diagnostic for this species.

**Carapace** Width of head 5/8 of greatest width of carapace.

**Eyes** Group occupies 11/16 of width of head. From in front anterior row procurved and from above posterior row procurved. Ratio of AME.ALE.PME.PLE = 9.10.10.10. AME separated from each other by 5/9 and from the ALE by 4/9 of diameter of an AME. Laterals separated by 1/9. PME separated from each other by 9/9 and from PLE by 8/9. MOQ wider behind than in front in ratio of 29.23 and as long as wide behind. Height of clypeus 8/9 of diameter of an AME.

**Chelicerae** Number and placing of teeth typical, but promarginal teeth slightly separated from each other. Length 7/10 of length of carapace.

**Palp** Spines. Femur, d.1.1.1. Patella, 1.1. Tibia, d.1. p.1 basal, 1.1 distal. r.0. Numerous spines on tarsus. Trichobothria. p.4. r.5. Claw with nine teeth.

**Legs** Shallow notches on trochantera of posterior pairs of legs. Spines. First leg. Femur, prolateral spine present, d.1.1.0. p.r.1.1. Patella, 1.1 (bristles), Tibia, v.0.2.0. p.r.0.0.1. d.1 basal (bristle), Metatarsus, v.2.2.3. p.1 median. r.0. Second leg. Femur, patella and tibia same

Figs. 963-964 *Neolana pallida* n.sp. Fig. 963 Epigynum. Fig. 964 Internal genitalia.

Fig. 965 *Aorangia ansa* n.sp. female.

as first leg. Metatarsus, v.2.2 and subwhorl of 5, p.r.1 median. Third leg. Femur, d.1.1.0. p.r.1.1. Patella, 1.1. Tibia, v.0.1.2. p.r.1.1. d.1 basal. Metatarsus, v.2.2 and subwhorl of 5, p.0.1. r.1.1. Fourth leg. Femur, d.1.1.0. p.r.0.1. Patella, 1.1. Tibia, v.0.0.2. p.r.1.1. d.1 basal. Metatarsus, v.1.2 and subwhorl of 5, p.1.1. r.1 calamistrum 1. Calamistrum occupies 0.35 of length of segment. Trichobothria. First leg. Tibia, p.4 on basal quarter, r.5 extending to midpoint. Metatarsus, 4. Tarsus, 5. Other legs resemble the first leg except tibia of fourth leg which has p.2.1.1.1 and retro-row of 6. Inferior claw with two teeth and superior claws with ten teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 963, 964. Cribellum divided, strongly sclerotized along posterior margin and wider than long in ratio of 33.10. Space occupied by the anterior spinnerets wider than that occupied by cribellum in ratio of 43.33.

**Types** Holotype female. Auckland. Waihapokopoko, Eastern Bay of Plenty, from beneath web on tree trunk, 2.x.1969, C. L. Wilton (Otago Museum).

#### INCERTAE SEDIS

We have not been able to reach any finality on the correct placement of the genus *Aorangia*. A number of characteristics including the structure of the male bulb, suggest that the genus could be placed in the Family Amphinectidae but the development of the posterior pair of spinnerets, the absence of trichobothria from the tarsus of the palp and cymbium and the spination of the legs suggest that they are not amphinectids.

#### Aorangia n.gen.

Medium sized (body length 3.5-7.5mm) ecribellate spiders. Terrestrial, constructing a small sheet web. The eyegroup occupies about two-thirds of width of head. Eight eyes in two more or less straight rows. AME equal in size to PME or slightly smaller. Lateral eyes larger, subcontiguous. Legs with plumose hairs, strongly spined with spines which tend to stand out at right angles to segments. Trochanters deeply notched. Tarsal organ subdistal. Trichobothria in a double row on tibia and a single row on metatarsi and tarsi. Superior claws similar, strongly pectinate. Inferior claw strongly pectinate. Chelicerae with lateral boss. Two teeth on retro-margin and usually two on promargin. Labium notched at base, wider than long. Sternum scutiform, longer than wide. Six spinnerets. Distal segment of posterior pair elongate, as long as basal segment. Colulus flat, evenly clothed with hairs, wider than long. Epigynum simple usually with paired lobes. Epigynum weakly sclerotized. Area covered by internal genitalia extends over most of ventral surface of epigynal region. Internal genitalia receptaculate with ducts, broad and usually translucent, with tendency to become convoluted. Female palp with double row of trichobothria on tibia but none on tarsus. Claw pectinate. Male palp with processes on distal retro-lateral surface of tibia. Cymbium pointed distally, without trichobothria. Embolus originating distally and twisted. Median apophysis well developed. Bulb characterized by a large plate which arises from the tegulum on prolateral side.

Type species *Aorangia ansa* n.sp.

There are three distinct groups of species. The *ansa* group has a filiform embolus twisting along a membranous conductor while the *musciola* group also has a filiform embolus but shorter and

a more compact conductor. In both of these groups the tegular process is large and branched. In the *semita* group the embolus takes the peculiar angular form characteristic of *Makora* and *Dunstan* and the conductor while complex is compact and not membranous.

This distinctive genus is one of the most easily recognized of the New Zealand genera because of the long posterior spinnerets and the presence of plumose hairs on the legs. The spiders construct webs consisting of a number of horizontal sheets beneath stones and logs on the forest floor. Pitfall traps capture both males and females, and this suggests that they may also actively hunt prey. These spiders are also occasionally found in grassland and scrub.

This genus poses a number of problems. It does not seem to show any direct relationship with other New Zealand or Australian spiders of this general group and the family placing is problematical. It has therefore been decided to leave this genus unplaced at present.

**Colour** Carapace yellowish, with darker shading on lateral surfaces of head and three patches radiating out from each side of fovea. Abdomen mottled with dark brown.

**Carapace** Width of head 4/7 of width of thorax. Fovea distinct.

**Eyes** Eyegroup occupies 11/17 of width of head. From above anterior row strongly recurved and posterior row straight. From in front anterior row straight and posterior row procurved. Ratio of AME:ALE:PME:PLE = 9.12.9.11. AME separated from each other by 5/9 of

the diameter of an AME and contiguous with ALE. Lateral eyes contiguous. PME separated from each other by 9/9 and from PLE by 5/9. MOQ wider behind than in front in ratio of 31.23 and wider behind than long in ratio of 31.26. Height of clypeus 14/9 of diameter of an AME.

**Sternum** Longer than wide in ratio of 26.23. Anterior margin straight, lateral margins evenly curved. Posterior projection bluntly pointed, separating coxae 4 by 3/5 of width of a coxa.

**Maxillae** Slightly convergent. Lateral margins straight and parallel. Longer than wide in ratio of 8.5.

**Labium** Notched at base. Lateral margins straight and slightly convergent. Anterior margin gently incurved. Wider than long in ratio of 3.2.

**Chelicerae** Length of chelicerae 3/8 of carapace. Boss prominent. Both margins with two teeth.

**Palp** As in Figs. 972, 974, 982, 983. The tegular process of type specimen not typical, lacking one of the branches.

**Legs** 4312. Long and slender. Plumose hairs present. Spines. First leg. Femur, d.1.0.1.1. p.0.0.0.2. r.0.0.0.1. Patella, d.1.1. Tibia, v.0.1.1. p.1.0.0. r.d.1.1.0. Metatarsus, v.0.1.1. p.r.0.1.2. **Colour** Carapace yellow brown with dark streaks extending from behind lateral eyes to fovea. Three pairs of dark streaks radiate out from the fovea. Margin of thoracic region shaded with black. Legs yellow brown with dark bands. Abdomen heavily shaded with dark brown but with two pairs of pale patches on antero-dorsal surface. On live specimens posterior half of abdomen tinged with pink.

**Eyes** Eyegroup occupies 7/10 of width of head. From above posterior row straight and anterior row gently recurved. From in front anterior row straight and posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 8.10.10.12. AME separated from each other by 5/8 and from ALE by 2/8 of diameter of an AME. Lateral eyes separated by 2/8. PME separated from each other by 11/8 and from PLE by 9/8. MOQ wider behind than in front in ratio of 31.21 and wider behind than long in ratio of 31.28. Height of clypeus 19/8 of diameter of an AME.

**Chelicerae** Length 4/13 of carapace. Both margins with two teeth.

**Palp** Spines. Femur, d.1.1.1. Patella, d.1.1. Tibia, p.d.1.1. Tibia with ten trichobothria arranged 2.2.2.2. Claw with four teeth. Tarsal organ sub-distal.

**Legs** Spines. First leg. Femur, d.0.1.1.1. p.0.0.1.1. r.0.0.0.1. Patella, d.1.1. Tibia, v.2.2.1. p.r.1.1.1. d.1.1.0. Metatarsus, v.2.2.1. p.r.0.0.2. d.0.0.1. Second leg. Femur, d.2.0.1.1. p.r.0.0.0.1. Patella, d.1.1. Tibia, v.0.1.1. p.r.d.1.0.1. Metatarsus, v.1.2.1. p.r.0.1.2. Trichobothria. Tibia, 2.1.1.1.1. Metatarsus, 2. Tarsus, 4. Superior claws with 12-13 teeth. Inferior claw with four teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 994, 995. Posterior pair of spinnerets longer than anterior pair in ratio of 5.4. Colulus flat, slightly swollen on posterior surface.

##### Measurements

|       | Carapace | Abdomen | length | width | length | width | Total |
|-------|----------|---------|--------|-------|--------|-------|-------|
|       |          |         | 2.00   | 1.40  | 2.25   | 1.35  |       |
| Leg 1 | 2.25     | 0.70    | 2.10   | 2.25  | 1.40   |       | 8.70  |
| 2     | 2.00     | 0.65    | 1.70   | 1.90  | 1.15   |       | 7.40  |
| 3     | 2.00     | 0.60    | 1.60   | 1.90  | 1.05   |       | 7.15  |
| 4     | 2.25     | 0.60    | 2.15   | 2.60  | 1.35   |       | 8.95  |
| Palp  | 0.85     | 0.30    | 0.35   |       | 1.00   |       | 2.50  |

**Colour** Carapace and legs typical. Abdomen dark with very little pattern. There is a pale area on proximal half within which is a median band. Anterior spinnerets black. Basal segment of posterior spinnerets white with black outer surfaces and apical segment white at the base and becoming progressively darker towards the apex.

**Eyes** Ratio of AME.ALE.PME.PLE = 4.6.5.5. AME separated from each other by 2/4 of their diameter and almost touching ALE. PME separated from each other

by 4/4 and from the PLE by 3/4. MOQ wider behind than in front in ratio of 14.10 and as long as wide behind. Height of clypeus equal to diameter of an AME.

**Chelicerae** Modified (Fig. 970). There is a large hump on the frontal surface near the base. Promargin of groove with four teeth, two distal small. Two teeth on retromargin.

**Palp** Bulb and tibial processes as in Figs. 980, 1013, 1014.

**Type** Holotype male. Southland. The Wilderness, near Te Anau, 15.ii.1966, R. R. Forster, C. L. Wilton (Otago Museum).

Figs. 1022-1025 *Aorangia otira* n.sp. Fig. 1022 Ventral view of male palp. Fig. 1023 Tibial processes of male palp. Fig. 1024 Internal genitalia. Fig. 1025 Epigynum. Figs. 1026-1027 *Aorangia kapitensis* n.sp. Fig. 1026 Epigynum. Fig. 1027 Internal genitalia.

**Colour** Carapace pale cream. Dark shading on upper lateral surfaces does not extend forward as far as lateral eyes. Narrow black band on each of lateral margins. Eyes on black but pale colour of carapace extends between and separates PME. All segments of legs and palpi have black bands except tarsi. Distal portion of coxae black. Sternum, maxillae and labium black. Proximally there is a pale area on abdomen enclosing some shading, followed by a series of four narrow pale chevrons. Remainder of upper and lateral surfaces black. Ventral surface of abdomen less heavily shaded and separated from lateral surfaces on each side by broken cream band. Colulus, anterior spinnerets and distal segment of posterior spinnerets black and remaining parts of spinnerets pale cream.

**Eyes** Group occupies 2/3 of width of head. Ratio of AME.ALE.PME.PLE = 7.10.10.10. AME separated from each other by 3/7 and from ALE by 1/7 of diameter of an AME. Lateral eyes separated by 4/7. PME separated from each other by 8/7 and from PLE by 5/7. MOQ wider behind than in front in ratio of 28.17 and wider behind than long in ratio of 28.25. Height of clypeus 11/7 of diameter of an AME.

**Chelicerae** Modified, excavated transversely (Fig. 972). Promargin with three teeth, the median tooth largest. Bicuspid tooth on retromargin near base of fang.

**Palp** Bulb and tibial processes as in Figs. 985, 1020, 1021.

Inferior claw with four teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 1023, 1029. Posterior pair of spinnerets slightly less than twice as long as anterior pair.

**Type** Holotype female. Kapiti Island, September 1947, R. R. Forster (Dominion Museum).

**Records** Wellington. West side of Rimutakas, 13.iv.1948, R. K. Dell. Waikanae, foliage, 3.i.1948, R.R.F. Wiltons Bush, December 1952, J. S. Dugdale. Ngauraranga Gorge, Wellington, 19.iv.-1941, F. A. Bodley.

#### Family CTENIDAE Keyserling, 1877

Owing to the paucity of this group in New Zealand we have not been able to give much consideration to the problems brought up by Lehtinen (1967) regarding the limitation of the family Ctenidae other than his suggestion that the genus

*Argoctenus* be transferred to the Zoridae. While we have now concluded that *Argoctenus* is not present in this country, the new genus *Nemoctenus* established for *Argoctenus aurens* Hogg is undoubtedly related. Accepting the main characters of the Ctenidae as eight eyes in two strongly recurved rows, normally with two claws, thick claw-tufts and distinct scopulae we consider that the three genera recorded below are better placed in the Ctenidae, even in the restricted diagnosis of Lehtinen.

#### *Nemoctenus* n.gen.

Medium sized (body length 10-11mm) ecribellate spiders. Carapace with broad dark mid-lateral bands and a prominent dark band extending down entire mid-dorsal surface of abdomen. Hair tufts near eyes and along margin of posterior portion of the abdominal band. Eight eyes in two strongly recurved rows. AME distinctly smaller than PME. Two claws. Prominent claw tufts on all legs. Well developed scopulae on ventral surfaces of all tarsi and disto-ventral surfaces of the metatarsi. Trochanters strongly notched. Legs of female 4123. Trichobothria in double row on tibiae and tarsi and single row on metatarsi. Chelicerae with two teeth on retromargin and three teeth on promargin. Epigynum of the form shown in Fig. 1043. Internal

genitalia tubular and strongly convoluted. Receptaculum small. Male palp with tibia processes only. Embolus spiniform. Conductor short and membranous. Median apophysis well developed and strongly sclerotized.

Type species *Argoctenus aurens* Hogg 1911.

The type species of *Argoctenus* L. Koch is *A. igneus* L. Koch from Australia. Hogg when placing *aurens* into *Argoctenus* actually compared it with *A. vittatus* Simon from New Caledonia from which it differs considerably in colour pattern and spination. There is little doubt that this New Zealand species is not congeneric with *A. igneus* and a new genus is established for it.

**Colour** Carapace dark brown apart from a pale band along lateral margins and the dorsal surface of head. Sternum with dark brown shading along margins. Abdomen with a broad median dark band clearly defined to midway and less distinct on posterior half (Fig. 1030).

**Eyes** Both rows strongly recurved. Ratio of AME. ALE.PME.PLE = 9.14.11.10. AME separated from each other by 5/9 and from the ALE by 3/9 of diameter of an AME. Laterals widely separated by three times diameter of an AME. PME separated from each other by 7/5 and from the PLE by 15/5. MOQ wider behind than in front in ratio of 29.23 and longer than wide in front in ratio of 25.23.

**Sternum** Scutiform, longer than wide in ratio of 17.14.

**Labium** Notched at base. Twice as wide as long.

**Chelicerae** Short and vertical. Lateral boss present. Retromargin with two, promargin with three teeth.

**Legs** Scopulae strongly developed on ventral surface of all tarsi and metatarsi of legs 1 and 2. Weaker on metatarsi of legs 3 and 4. Trochanters deeply notched. Spines. Leg 1. Femur, d.1.1.1.1. p.1.1.1. distal. r.1.0.0. Tibia, v.2.2.2. Metatarsus, v.2.0.0. Leg 2. Femur, d.p.r.1.1.1. Tibia, v.2.2.2. p.0.1.0. Metatarsus, v.2.0.0. Leg 3. Femur, d.p.r.1.1.1. Tibia, v.2.2.2. d.p.r.1.1.0. Metatarsus, v.2.2.1. d.p.r.1.1.1. Leg 4. Femur, d.r.1.1.1. p.0.1.1. Tibia, v.2.2.2. d.p.1.1.1. r.1.1.0. Metatarsus, v.1.2.1. d.p.r.1.1.1.

**Palp** Spines. Femur, d.0.1.2. p.0.0.1. Patella, d.1.1. p.1.0. Tibia, d.1.1. p.2.1. Tarsus, d.1.0.0. p.2.1.0. v.0.0.1. r.1.1.0. Claw absent.

Fig. 1030 *Nemoctenus aurens* (Hogg). Immature, fourth instar.

Fig. 1031 *Nemoctenus aurens* (Hogg). Eggsac photographed on the underside of a surface rock in scree, Mount Kohurau, Otago, 5,000 ft.

**Abdomen** The epigynum of specimens from near the type locality as in Fig. 1043. Specimens from the foothills area appear to be smaller and the epigynum is as in Fig. 1045. Internal genitalia as in Figs. 1044, 1046.

#### MALE

A single specimen was examined some time ago but is not available at present for detailed description. In general it was similar to the female in appearance and structure. The palp was figured during the initial examination and is shown in Figs. 1032, 1033.

**Type** Holotype female. Mt Peel, Canterbury. R. N. Hawkes. British Museum (Nat. Hist.).

**Records** Canterbury. Mount Torlesse, 4,500 ft, under stones in scree, 5.i.1950, R.R.F. Mount Sugarloaf, 3,400 ft, 25.viii.1928, G. A. H. Helson. Mount Misery, 2,500 ft, 25.v.1954, J. S. Dugdale. Mount Acken, 25.iii.1954, J. S. Dugdale. South Branch, Hurunui River, 12.v.1952, J. S. Dugdale. Ribbonwood Creek, Cass, 21.v.1954, J. S. Dugdale. Lake Rubicon, 19.xi.1950, R.R.F.

The typical habitat for this species seems to be sub-alpine screes. It has been found from Mid-Canterbury to Otago. An eggsac collected from Mt Kohurau, Otago at 5,000 ft, which appears to be this species or a closely related one, was found

on the undersurface of a scree rock. Forty eight spiderlings emerged from the eggsac. These are at present being reared, and to date have passed through from three to four moults and appear to be about two-thirds grown.

#### *Horioctenoides* Main, 1954

1954 *Horioctenoides*, Main. Austr. Geogr. Rep. No. 1: 42.

Type species *Horioctenoides bidentatus* Main.

The species described below has been tentatively placed in the genus established by Main for a female specimen found in the Archipelago of Recherche, Western Australia and described as *H. bidentatus*. As this spider is thought to have been introduced into this country we have not given it a name but it does seem to differ from the type species in a number of characters. The species is easily separated from the two other ctenids recorded from New Zealand by the colour pattern, the fully scopulate metatarsi and tarsi, equal sized median eyes, and the strong development of hair tufts near the eyes and on the posterior half of the abdomen.

| Palp | 1.56     | 0.97    | 1.08   |            | 1.51   | 5.12  |

**Colour** Carapace with broad black band down each mid-lateral surface. Abdomen with clearcut black band down anterior half of dorsal surface. Dorsal and lateral surfaces closely speckled with dark brown spots. Ventral surface of abdomen pale. Sternum heavily shaded with brown apart from a pale median band. Tufts of pale silky hairs near ALE and on anterior corners of head. Further similar hairs along thoracic margins and on dorsal surfaces of trochantera.

**Eyes** Both rows strongly recurved. Ratio of AME. ALE.PME.PLE = 11.9.11.12. AME separated from each other by 7/11 and from ALE by 5/11 of diameter of an AME. Laterals widely separated by 16/11 of diameter of an AME. PME separated from each other by 7/11 and from PLE by 20/11. MOQ almost square. Anterior

and posteriors widths equal but longer than wide in front in ratio of 30.29.

**Sternum** Scutiform, longer than wide in ratio of 25.22. Posterior projection short and pointed, not extending far between coxae which are closely spaced.

**Maxillae** Longer than wide in ratio of 3.2.

**Labium** Notched at base. Wider than long in ratio of 8.5.

**Chelicerae** Relatively short and vertical. Lateral boss present. Retromargin with two, and promargin with three teeth.

**Legs** Ventral surfaces of metatarsi and tarsi of all legs with thick scopulae. A weak scopula on distal ventral surface of tibiae of first two pairs of legs. Trochantera deeply notched. Spines, Leg 1. Femur, d.1.1.1. p.0.1.1.1. r.1.0.1. Tibia, r.1.2.2. p.0.1.0. Metatarsus, v.2.0.0. Leg 2. Femur, d,r,p.1.1.1. Tibia, v.2.2.2. p.1.1.0. Metatarsus, v.2.0.0. Leg 3. Femur, d,r,p.1.1.1. Tibia, v.2.2.2. p,r.1.1.0. Metatarsus, v.2.0.0. p,r.1.1.1. d.1.1.0. Leg 4. Femur, d,p.1.1.1. r.0.1.1. Tibia, v.2.2.2. p,r.1.1.0. d.2.1.1. Metatarsus, v.2.2.1. p,r.1.1.2. d.1.1.1.

**Palp** Spines. Femur, d.0.1.2. p.0.0.1. Patella, d.2.1. Tibia, d.1.1. p.2.1. Tarsus, d.1.0.0. p.2.1.0. v.0.0.2. r.1.1.0. Claw well developed with three teeth.

**Abdomen** Shape of epigynum and to a less extent the form of genitalia differs between most of the specimens

Figs. 1034-1038 *Horioctenoides* sp. Fig. 1034 Epigynum, Waiterere Beach. Fig. 1035 Internal genitalia, Waiterere Beach. Fig. 1036 Epigynum, Takaka. Fig. 1037 Epigynum, Masterton, specimen taken from bulbs imported from Australia. Fig. 1038 Internal genitalia, Masterton.

Figs. 1039-1041 *Zealoctenus cardronaensis* n.sp. Fig. 1039 Epigynum. Fig. 1040 Internal genitalia from below. Fig. 1041 Internal genitalia from above.

examined (Figs 1034, 1036, 1037) and it is difficult to judge whether they represent a single species or not. No definite colulus structure but area at base of spinnerets nearly bare and triangular in outline.

**Records** Waiterere Beach, Levin, in maram grass, 16.i.1964, R. G. Ordish (specimen described). Foxton, in rough grass, December 1967, R.R.F. (immature specimen illustrated fig. 1028). Dashwood Railway Station, Marlborough, pitfall trap in grass, 16-25.iii.1969, R.R.F., C.L.W. Takaka Cave near mouth, 16.xii.1961, B. J. Marples. Masterton, from bulbs from Australia, 4.ii.1971, Dept Agriculture. J. S. Dugdale reports

that this species is often seen in gardens in Nelson.

Only single female specimens from a number of localities have been available for examination. From the limited data it appears that the spider prefers rough pasture and long grass and its distribution suggests that it is an introduced species or perhaps a group of species. The undoubted relationship of all of the specimens with the spider intercepted from Australia would suggest that it is an Australian species. We have not been able to relate it directly with any of the described Australian species but consider that it may be related to the ctenid described by Main (1954) as

*Horioctenoides bidentatus* n.gen. n.sp. from Figure of Eight Island, Archipelago of the Recherche, Western Australia.

#### *Zealoctenus* n.gen.

Medium sized (body length 7.5mm) ecribellate spiders. Carapace and abdomen with longitudinal blackish bands down mid-lateral surfaces leaving pale band down median surface (Fig. 1029). No conspicuous hair tufts on abdomen. Eight eyes in two strongly recurved rows. AME distinctly smaller than the PME. Legs 4231. Strong claw tuft. Leg 1 only weakly scopulate. Thick scopula on distal surface of the tibia, and entire ventral surface of metatarsus and tarsus of leg 2 but only distal surface of metatarsus and entire surface of tarsus of legs 3 and 4. Two claws. Trochanters deeply notched. Trichobothria in a double row on tibiae and tarsi. Single row on metatarsi. Epigynum distinctive (Fig. 1039) and internal genitalia tubular but not strongly convoluted. Chelicerae with two teeth on retromargin and three on promargin.

Type species *Zealoctenus cardronaensis* n.sp.

The colour pattern is most distinctive and contrasts strongly with that of *Nemoctenus*. The shortness of the first pair of legs is unusual. Unfortunately the male of the sole species recorded is not known but the epigynum and internal genitalia diverge from the typical form found in this family. Only a few specimens have been found, including one mature female. It seems that these spiders inhabit grassland and scrub rather than scree as is characteristic of *Nemoctenus*.

*Abdomen* Anterior pair of spinnerets stout, contiguous. Posterior pair more slender and slightly longer. No distinct colulus. Epigynum and internal genitalia as in Figs. 1039, 1041.

*Type* Holotype female. Otago. Cardrona Valley, beaten from grass, 21.xii.1969, C. L. Wilton (Otago Museum).

#### Family PSECHRIDAE Simon 1890

The status of the family Psechridae and the relationship of the two genera usually placed in the family today (*Psechrus*, *Fecenia*) is puzzling. Dalmas (1917) placed *Stiphidion*, (designated by us as the type genus of the new family Stiphidiidae) his genus *Stiphidiellum* (synonym of *Laestrygon*, family Desidae) and the Matachiinae (now Desinae, Desidae) within the family. Two further genera previously included in the family, *Metafecenia* and *Themacrys*, have been

recently transferred by Lehtinen (1967) to his Miturgidae and Amaurobiidae respectively.

Lehtinen (1967) gives the following definition of the family Psechridae covering the two genera *Psechrus* and *Fecenia*.

Carapace pear-shaped, eyes in two recurved rows, fovea large and longitudinal, clypeus high. Sternum with more or less distinct marginal elevations. Labium free, distally notched. Maxillae long, with a median scopula. Chelicerae with strong teeth on both margins of the fang groove, fang with smooth basal part.

Abdomen long, more or less cylindrical, with distinct dorsal and ventral pattern. Cribellum bipartite, as wide as the area of the spinnerets. Anterior spinnerets very large, conical; posterior spinnerets cylindrical and with a short apical segment. Median spinnerets exceptionally long and slender. Tracheal stigma close to the cribellum. Legs long, strongly spinulated on femora and tibiae, and metatarsi. In males the first leg enormously lengthened and its tarsi and metatarsi covered with long erect hairs. Tarsal trichobothria very indistinct, but usually there are some with equal length. Tarsi with three toothed claws and rather well developed claw-tufts composed of longitudinally arranged coarse hairs. Ventral hairs of tarsi usually more densely spaced than elsewhere, but no true scopulae comparable to these structures in e.g. Ctenidae and Theraphosidae exist.

Calamistrum very characteristic, consisting of 3-5 regular rows of true calamistrum hairs. Epigynal area well chitinized, divided by longitudinal furrows into a central septum and lateral lobes, but the septum is seldom (*Fecenia*) distinctly limited anteriorly.

Male palpus robust. Femora, patella and tibia may have simple processes or elevations, but no complicated apophyses. Bulbal organs highly variable, even concerning the presence of sclerites.

Of the two genera included below from New Zealand, *Haurokia* seems to show some direct relationship with *Fecenia* when consideration is

given to the male and female genitalia but differs from it in a number of important characters, such as the absence of claw-tufts and the single row of calamistrum hairs. *Poaka* differs much more radically and it is with considerable doubt that it is placed in this family. The eyes of *Poaka* are placed in two more or less straight rows while the simple hooked median apophysis of the male palpal bulb and the presence of an extra median sclerite are quite different from *Haurokia*. Both genera have three tarsal claws and no claw-tufts or scopulae. The habits of the two New Zealand genera are also very different. *Psechrus* and *Fecenia* both apparently construct large sheet snares with the spiders moving on the under surface as does *Cambridgea* in New Zealand. *Haurokia* and *Poaka* are both hunters which as far as we have noted do not construct snares. *Poaka* is found on grass or low plants in open country and along forest margins while *Haurokia* frequents low fern and shrubs in damp forest.

#### *Poaka* n.gen.

Small (body length 4-5mm) cribellate spiders. Carapace with two longitudinal narrow black bands extending back from eyes. Abdomen with a narrow median longitudinal band and a broken band down each dorso-lateral surface (Figs. 1047, 1048). Carapace humped around fovea (Fig. 1049). Eight eyes in two rows. Anterior row straight. Posterior row slightly recurved. AME distinctly smaller than PME. Chelicerae with two teeth on retromargin and three on promargin. Legs 1423. Trochanters not notched. Many spines in double row on ventral surface of tibia and metatarsus of legs 1 and 2. Trichobothria in a double row on tibiae but a single row on metatarsi and tarsi. Three claws, without claw tufts. Scopulae lacking. Calamistrum well developed in female, proximal. Absent from male. Cribellum small, divided in female, non-functional in male. Epigynum simple with an antero-median lobe. Internal genitalia receptaculate, opening anteriorly. Male bulb with simple hooked median apophysis. Embolus slender and spiniform with an elongate membranous conductor which originates at base of embolus and extends to tip. A second elongate translucent plate originates from mid-ventral surface and extends forward beyond bulb. Cymbium extending well beyond bulb. Processes on retro-lateral surface of tibia.

Type species *Poaka graminicola* n.sp.

These spiders which live in grass and low shrubs do not seem to construct a snare. The

eggsac is not known. The single known species is found in both in both North and South Islands.

#### *Poaka graminicola* n.sp.

|      | Abdomen  | length  | 3.25  | width      | 1.80   |       |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus | Total |
| 1    | 1.70     | 0.65    | 1.95  | 1.50       | 0.45   | 6.25  |
| 2    | 1.20     | 0.50    | 1.15  | 1.05       | 0.40   | 4.30  |
| 3    | 1.00     | 0.50    | 0.75  | 0.90       | 0.30   | 3.45  |
| 4    | 1.50     | 0.55    | 1.30  | 1.40       | 0.45   | 5.20  |
| Palp | 0.50     | 0.25    | 0.30  |            | 0.55   | 1.60  |

*Colour* Colour generally pale with dark olive pattern as in Fig. 1047. Legs pale with dark patches and with dark partial bands distally on tibiae and metatarsi especially posterior legs. The very pale sternum has a conspicuous black median band for most of its length.

*Carapace* Profile as in Fig. 1049. Width of head 13/25 of greatest width of thorax.

*Eyes* Group occupies 4/5 of width of head. From in front anterior row straight and from above posterior row slightly recurved. Ratio of AME:ALE:PME:PLE = 4.6:5.6. AME separated from each other by 2/4 and from ALE by 4/4 of diameter of an AME. Laterals almost touching. PME separated from each other and from PLE by diameter of AME. MOQ wider behind than long in ratio of 14.10 and as wide behind as long. Height of clypeus 3/4 of diameter of an AME.

*Sternum* Longer than wide in ratio of 27.20. Scutate. Posterior projection tapers broadly to blunt point and posterior coxae well separated. Anterior margin indented to accommodate the convexity of labium.

*Maxillae* Longer than wide in ratio of 12.7 and twice as long as labium.

*Labium* Wider than long in ratio of 8.6 slightly notched basally and distal margin slightly indented.

*Chelicerae* Promargin with three teeth and retromargin with two teeth.

*Palp* Spines. Femur, d.1.0.1. p,r.0. Patella, 0.1. Tibia, d.1. p.1. r.0. Trichobothria. Tibia, 2. Tarsus, 1.1.1 on basal half and a sub-distal tarsal organ.

*Legs* 1423. Dorsal femoral spines short and situated on individual black spots. Distal half of prolateral surface of first pair of legs with a row of three spines, basal one longest and distal much shorter than other row. Spines not on black spots. Some of ventral spines of tibia and metatarsi of first and second pairs of legs

Figs. 1047-1048 *Poaka graminicola* n.sp. Fig. 1047 Female. Fig. 1048 Male.

very long. Basal spines on tibiae almost half length of segment while those of metatarsi 5/8 of length of that segment. Spines become shorter distally so that when in prone position they do not project beyond end of segment, except on metatarsus of second pair of legs. First leg. Femur, d.1.1.0. v.r.0. p.1.1.1. Patella, 0. Tibia, 2.2.2.2.2.2.2.1, d.1 (small) basal. Metatarsus, v.2.2.2.2.1. Second leg. Femur, d.1.1.0. p.r.0.0. Tibia, ventral spines not paired and there is a pro-row of 7 and a retro-row of 5. p.1 median. r.0. d.1 (small) basal. Metatarsus, v.2.2.2.2. p.1.1. r.0. Third leg. Femur, d.1.0.1. p.r.0. Tibia, v.0.1.0. p.1.1. r.d.1. Metatarsus, v.1.2.0. p.1.2. r.0.2. d.1. Fourth leg. Femur, d.1.0.1. p.0. r.0.1. Tibia, v.0.1.0. p.r.0.1. d.1. Metatarsus, v.1.2.0. p.1.2. r.0.2. The calamistrum extends down half the length of the metatarsus. Trichobothria. First leg. Tibia, p.3 on basal third, r.4 to almost 2/3 length of segment. Metatarsus, 3. Tarsus, 4 and distal tarsal organ. Superior claws relatively small with four teeth which increase in size distally on basal half.

**Abdomen** Epigynum and internal genitalia as in Figs. 1053, 1054. Cribellum and spinnerets as in Fig. 1050.

Lake Rotoehu, near Hongi's Track, 4.x.1969, C.L.W., one female.

#### *Haurokoa* n.gen.

Small (body length 3-3.3mm) cribellate spiders. Carapace with black band down lateral margins and black patches extending a short distance back from eyes (Fig. 1055). Thoracic region of carapace not humped. Eight eyes in three rows, 4.2.2. Anterior row slightly recurved but posterior four eyes strongly recurved. AME much smaller than PME. Chelicerae with two teeth on retro-margin and three on promargin. Legs. Male 1423, female 1243. Ventral surfaces of tibiae and metatarsi of first two pairs of legs with numerous long spines in two rows. Trochanters not notched. Three claws. Claw-tufts and scopulae absent. Calamistrum proximal, in a single row. Cribellum small, entire. Calamistrum and spinning fields of cribellum lacking in male. Trichobothria in a double row on tibiae and tarsi, single row on metatarsi. Trichobothria extend beyond tarsal organ. Epigynum without distinct surface features. Internal genitalia receptaculate, opening posteriorly. Male palp with apophyses on tibia and patella. Embolus spiniform, distal, short. Conductor as a small membranous plate. Median apophysis relatively large, sclerotized.

Type species *Haurokoa filicifolia* n.sp.

This genus shows some affinities with *Fecenia* but the cribellum is small and claw-tufts are lacking. The habits seem to be quite different as these spiders hunt on low foliage while *Fecenia* constructs a large sheetweb.

#### *Haurokoa filicicola* n.sp.

##### Measurements

|      | Carapace | length  | 1.70  | width      | 1.25   |
|------|----------|---------|-------|------------|--------|
|      | Abdomen  | length  | 1.30  | width      | 0.90   |
| Leg  | Femur    | Patella | Tibia | Metatarsus | Tarsus |
| 1    | 1.90     | 0.70    | 2.15  | 1.85       | 0.55   |
| 2    | 1.50     | 0.60    | 1.45  | 1.35       | 0.50   |
| 3    | 1.25     | 0.50    | 0.95  | 1.00       | 0.40   |
| 4    | 1.50     | 0.50    | 1.20  | 1.30       | 0.50   |
| Palp | 0.60     | 0.25    | 0.20  |            | 0.50   |
|      |          |         |       |            | 1.55   |

**Colour** Carapace very pale cream with a wide dark stippled band near lateral margins of thorax. A band with an orange tinge extends posteriorly from each PLE to about two thirds of distance to fovea. There is also a narrower band of a similar hue mid-dorsally between eyes and fovea. Eyes on black spots. Chelicerae have dark stippled shading on anterior surfaces for about two thirds of length. Legs pale without dark bands. Sternum white and labium transparent. On dorsal surface of abdomen there is a dark band, better defined anteriorly, on basal half of each side and followed by row of four dark spots on each side. The rest of surface of abdomen pale but clothed with reddish hairs. Ventral surface pale without pattern.

Fig. 1055 *Haurokoa filicicola* n.sp. Male.

Figs. 1056-1059 *Haurokoa filicicola* n.sp. Fig. 1056 Lateral view of male palp. Fig. 1057 Ventral view of male palp. Fig. 1058 Epigynum. Fig. 1059 Internal genitalia.

**Carapace** Rather low. Width of head 3/5 of thorax. Fovea longitudinal.

**Eyes** Group occupies 11/15 of width of head. From in front anterior row is straight by centres of eyes and posterior row straight. From above anterior row slightly recurved and posterior row strongly recurved. Ratio of AME:ALE:PME:PLE = 2.7:6.7. AME separated from each other and from ALE by 3/2 of diameter of an AME. Laterals separated by 9/2. PME separated from each other by 5/2 and from PLE by 6/2. MOQ wider behind than in front in ratio of 17.7 and wider behind than long in ratio of 17.14. Height of clypeus equal to diameter of an AME.

**Sternum** Scutate. Longer than wide in ratio of 30.25. Anterior margin broadly indented. Posterior projection pointed and separates posterior coxae by half diameter of a coxa.

**Maxillae** Longer than wide in ratio of 18.12 and longer than labium in ratio of 18.10. Slightly divergent. Rather flat distally with outer angles rounded and with conspicuous serrula.

**Labium** Wider than long in ratio of 11.10. Rounded, almost semi-circular. Rebordered.

**Chelicerae** Vertical. Lateral condyles present. Promargin with three teeth and retromargin with two.

**Palp** Spines. Femur, d.0.1.1. p.1. r.0. Patella, 1.1. Tibia, d.p.1. Trichobothria. Tibia, d.4 and 1 on the base of the basal process. Cymbium with tarsal organ. Bulb, tibial and patellar processes as in Figs. 1056, 1057.

**Legs** 1243. Hairs very finely ciliate. Trochanters not notched. Ventral spines on tibiae and metatarsi of anterior legs are long excepting distal ones. Spines. First leg. Femur, prolateral spine present, d.1.1.1. p.r.0.1. Patella, 1.1 (small). Tibia, v.2.2.2.2.2.2. p.r.0.1.0. d.1 minute. Metatarsus, v.2.2.2.2. p.r.1.0. d.1. Second leg. Femur, d.1.1.1. p.1.1. r.0.1. Metatarsus, v.0.2 and a subwhorl of 5,

p.r.1. d.1. Fourth leg. Femur, d.1.0.1. p.r.0.1. Patella, 1.1. Tibia, v.1.1.2. p.r.1.1. d.1. Metatarsus, v.0.2 and subwhorl of 5, p.0.1. r.1.1. d.1. Trichobothria. Tibia, p.3 on basal half. r.4 extending to two thirds of length of segment. Metatarsus, 4. Tarsus, four in two rows, the 2nd and 4th in anterior row and 1st and 3rd in posterior row. Tarsal organ sited between third and fourth trichobothria. Superior claw of anterior leg with seven teeth and inferior claw with two teeth. Superior claw of fourth leg has six teeth.

**Abdomen** Cribellum, which is probably not functional, is a broadly based cone with rounded summit. Anterior spinnerets separated by a quarter of diameter of anterior spinnerets. Posterior spinnerets shorter than anterior spinnerets and only about half their diameter. Distal segment conical and two fifths of length of basal segment.

Resembles male in colour and general characteristics. Spination of the legs as in male. Calamistrum well developed. Ten setae in a single row occupying one third of length of metatarsus.

**Palp** Spines. Femur, d.0.1.1. p.1. r.0. Patella, 0.1. Tibia, d.p.0.1. r.0. Tarsus with numerous spines. Trichobothria. Tibia with two rows of 3. Tarsus, 0. Small subdistal tarsal organ. Claw with eleven small teeth.

**Abdomen** Epigynum and internal genitalia as in Figs. 1058, 1059. Cribellum entire and rather small.

**Types** Holotype male. Southland. Lake Hauroko, 11.iii.1970, C. L. Wilton. Allotype female. Lake Hauroko, 25.xi.1970, R. R. Forster, C. L. Wilton (Otago Museum).

Fig. 1060 *Nuisiana arboris* (Marples), Female.

#### Family DESIDAE Pocock, 1895

The family Desidae was treated in a previous volume of this work (Forster, 1970). Further species belonging to existing genera have been discovered since this publication appeared and these will be described in the final volume of the series. However some of the species require the establishment of new genera and these are described below.

#### Subfamily DESINAE Pocock, 1895

##### *Nuisiana* n.gen.

Large cribellate spiders (12mm in body length), similar to *Matachia* but not modified for life in narrow burrows. Carapace normal. Eyes subequal, in two rows. Anterior row straight. Posterior row gently procurved. Lateral eyes contiguous. Sternum scutiform, only slightly longer than wide and pointed posteriorly. Labium longer than wide and notched at the base. Maxillae strong and parallel. Chelicerae vertical, with boss. Retromargin with two and promargin with four teeth. Legs 1243, clothed with short ciliate hairs and longer smooth,

apically bent hairs. Trichobothria short but numerous. In a double row on tibiae and a single row on metatarsi and tarsi. Spination strong. Superior claws similar, strongly pectinate. Inferior claw with two teeth. Claw tufts and tenent hairs lacking. Trochantera notched. Calamistrum well developed in the female, proximal. Cribellum prominent, more than twice as wide as long. Spinning field narrow, entire. Anterior spinnerets stoutly conical, contiguous. Posterior spinnerets more slender and slightly longer. Epigynum strongly sclerotized, with posterior pair of spines. Internal genitalia with spherical receptacula, a short strongly sclerotized duct followed by a stout thin walled duct which opens posteriorly (Fig. 1062). Tracheal system similar to *Matachia* and restricted to abdomen.

Type species *Maniho arboris* Marples 1959.

This genus is very closely related to *Matachia*. The adaptive features of *Matachia* related to the use of narrow tunnels separate the two genera. *Matachia* is elongated and the first three pairs of legs are directed forward whereas *Nuisiana* has a normal cephalothorax and the third pair of legs are directed behind. The habits of *Nuisiana* are not well known but Marples (1959) found the

Figs. 1061-1062 *Nuisiana arboris* (Marples). Fig. 1061 Epigynum. Fig. 1062 Internal genitalia.

specimens he described beneath the bark of totara. The genitalia of the female are readily derived from those of *Matachia*. It is probable that the male described earlier (Forster, 1970) as *Matachia magna* from Cuvier Island in the Hauraki Gulf, Auckland does in fact belong to this genus. If this is so the male genitalia are very close to those of *Matachia*.

| Palp | 2.61     | 2.50    |       | 2.33       |        | 7.44  |

**Colour** Carapace yellow, darkening around eyes and head region. Abdomen yellowish with median folium down dorsal surface which is widest medially. Legs yellow. Chelicerae reddish.

**Eyes** From above and in front anterior row straight and posterior row procurved. Ratio of AME.ALE.PME.PLE = 6.7.5.6. AME separated from each other by 6/6 and from ALE by 10/6 of diameter of an AME. Lateral eyes subcontiguous. PME separated from each other by 11/6 and from PLE by 14/6. MOQ wider behind than in front and wider behind than long in ratio of 7.6. Width of clypeus slightly more than width of an AME.

**Chelicera** Retromargin with two and promargin with four teeth.

**Abdomen** Epigynum as in Figs. 1061. Median lobe produced posteriorly to a relatively sharp point and paired projections long and blunt. Internal genitalia (Fig. 1062) relatively simple with small receptacula from which strongly sclerotized ducts lead forward and bend before expanding into thin walled ducts which curve back to posterior openings.

**Legs** 1243. Clothed with finely ciliate hairs and longer, apically bent, smooth hairs as in *Matachia*. Trichobothria numerous but short. Spines. First leg. Femur, d.1.2.2.

p.0.1.1. Tibia, v.0.2.2. p.r.1.1.1. Metatarsus, v.2.2.1. p.r.1.1.2. Second leg. Femur, d.1.1.1. p.r.0.1.1. Tibia, d.0.1.0. r.0.1.1. Tibia, d.0.1.0. p.r.1.1.0. v.0. Metatarsus, v.2.2.1. p.r.1.1.2. d.0.1.0. Third leg. Femur, d.p.1.1.1. r.1.0.1. Tibia, d.0.1.0. p.r.1.1.0. v.0.0.2. Metatarsus, d.0.1.1. p.r.1.1.2. Fourth leg. Femur, d.1.1.1. p.r.0.0.1. Tibia, d.0.1.0. p.r.1.1.0. v.0.0.2. Metatarsus, d.0.1.1. p.r.1.1.2. v.2.2.1. Superior claws similar with ten teeth. Inferior claw with two teeth. No claw tufts or tenent hairs.

**Type** Holotype female. Southland. Tuatapere, May 1956, R. R. Marples (Otago Museum).

**Records** Single female specimens have been collected from a number of localities throughout New Zealand and these are listed below. The epigynum and internal genitalia are similar throughout although differences can be seen. It is probable that a number of species are present. Hen Island, January 1968, M. Grantham. Little Barrier Is., December 1966, I. Townsend. Algies Bay, Warkworth, 1.vii.1970, D. Court. Wairarapa, Solway, 24.ix.1966, R. W. Hutton. Waituna, 25.viii.1965, R. W. Hutton. Canterbury, Hoods Bush, Malvern Hills, May 1952, R.R.F. Foxs Creek, February 1963, R.R.F. Nelson, 21.vi.1948, A. W. Parrott.

It seems probable that the male described as *Matachia magna* (Forster, 1970) from Cuvier Island belongs to *Nuisiana* and is perhaps the male of the specimens recorded above from Hen Island and Little Barrier Is. Marples (1959) found the specimens he described living beneath the bark of large Totara trees. He noted that the web was small and remarked that it was similar to that of *Neoramia charybdis*. However in view of the close relationship of these spiders to *Matachia* it is most likely that the web would show the laddered form typical for most of the spiders of this group.

#### Sub-family MYRONINAE Lehtinen, 1967

##### *Hulua* n.gen.

Small cribellate spiders (body length 2-3mm). Eight eyes, in two rows, occupying little more than one half of width of head. Both rows straight or nearly so, AME much smaller than remaining eyes which are subequal. Chelicerae with two teeth on retromargin and five or

Fig. 1063 *Hulua minima* n.sp. Female.

more on promargin. Epigynum simple, weakly sclerotized. Internal genitalia with pair of spermathecae and well developed ducts, usually convoluted. Male palp with filiform embolus running under narrow outer lip of large, mainly membranous, conductor. Median apophysis well developed, spatulate. Tibia with basal spinous process on retrolateral surface and a distal plate. Cymbium broad but strongly emarginate along distal promargin so that the distal portion is slender and pointed. Legs 4123 or 1423 with relatively few spines. Trichobothria in a single row on metatarsus and tarsus, double row on tibia. Tarsal organ distinct, subdistal. Superior claws with from 5-8 teeth. Inferior claw with two teeth. Claw tufts and scopulae absent. Six spinnerets. Anterior pair stout, distal segment short. Posterior pair slender, longer than anterior spinnerets, with distal segment long, over half of the length of basal segment. Cribellum small, rectangular, much wider than long. Spinning field small, divided. Calamistrum proximal. Tracheal system limited to abdomen.

**Type species** *Hulua convoluta* n.sp.

These small spiders are found on the forest floor where they appear to be vagrants. The three species recorded are from the North Island and the northern portion of the west coast of the South Island but other specimens examined but not described come from Canterbury and from the Greymouth region of the west coast of the South Island. *Hulua* is the first cribellate genus placed in the Myroninae.

| 4    | 1.35  | 0.41    | 1.17  | 1.27       | 0.66   | 4.86  |
| Palp | 0.53  | 0.18    | 0.21  |            | 0.68   | 1.60  |

**Colour** Basic colour of body and appendages straw yellow. Carapace with black shading on median surface and abdomen with a chevron pattern on dorsal surface. Legs with areas of dark shading.

**Carapace** Relatively wide, only slightly longer than greatest width. Narrowing sharply to eye region. Head region not distinctly separated. Fovea distinct but narrow.

**Eyes** Group occupies 5/8 of width of head. From above both rows straight but both slightly procurved from in front. Ratio of AME.ALE.PME.PLE = 1.4.5.6. AME separated from each other and from ALE by the width of an AME. Lateral eyes separated by three times this width. PME separated from each other by twice and from the PLE by distance equal to width of an AME. MOQ wider behind than in front in ratio of 12.3 and longer than wide in the front in ratio of 11.3. Clypeus six times width of an AME.

**Sternum** Scutiform. Longer than wide in ratio of 6.5. Broadly obtuse posteriorly, separating coxae 4 by the width of a coxa.

**Maxillae** Longer than wide in ratio of 15.11. Rectangular and almost parallel. Serrula well developed. Scopula weak.

**Chelicerae** Retromargin with two teeth in mid-line. Promargin with seven teeth of which second from base is largest.

**Legs** Superior claws with five teeth, inferior with two. Tarsal organ subdistal. Spines. First leg. Femur, d.0.1.0. Patella, d.1.1. Tibia, d.1.0.0. p.1.0.1. Metatarsus, v.0.0.1. Second leg. Leg 3, 1.2.2.1. Leg 4, 1.2.1.1. Calamistrum proximal with 9 hairs.

**Palp** (Figs. 1064, 1065). Embolus threadlike and fits under marginal flange of large, thin and transparent conductor. Median apophysis well developed, median in position and strap-like. Cymbium broad and not strongly concave. Inner margin curves in so that distal portion is narrow. Trichobothria not present on cymbium.

**Abdomen** Six spinnerets. Anterior pair with stout basal segment. Distal segment short and conical. Separated at base by 5/7 of basal width of spinneret. Posterior pair slender with distal segment 2/3 length of basal and longer than anterior pair. Cribellum rectangular, wider than long in ratio of 8.5. Anterior margin deeply notched. Spinning areas small, divided.

| Palp | 0.30  | 0.12    | 0.19  |            | 0.24   | 0.85  |

**Colour** Carapace pale reddish brown. Legs pale yellow brown. Abdomen purplish grey.

**Eyes** Eyes large but form compact group which occupies slightly more than half of width of head. From above both rows appear straight but from in front anterior row straight and posterior row slightly procurved. Ratio of AME.ALE.PME.PLE = 2.5.4.6. AME separated from each other by 2/2 and from ALE by 1/2 of diameter of an AME. Lateral eyes contiguous. PME separated from each other by 2/2 and from PLE by 1/2. MOQ wider behind than in front in ratio of 5.3 and wider behind than long in ratio of 5.4.

**Sternum** Scutiform, as wide as long. Anterior margin straight, laterals evenly curved. Anterior margin oblique. Longer than wide at base in ratio of 3.2.

**Labium** Notched at the base. Lateral margins slightly convergent. Anterior margin straight. Wider at base than long.

**Chelicerae** Retromargin with two, promargin with three teeth. Carina extends from proximal promarginal tooth to base of chelicera.

**Palp** Metatarsus with three spines in a row on the prolateral surface, otherwise only bristles are present. Trichobothria. Tibia, 2.1. Tarsus, 1.1. Claw with four minute teeth.

**Legs** 1423. Spines on first two pairs of legs long and strong but reduced in size and number on legs 3 and 4. First leg. Femur, d.0.1.0.0. p.0.0.0.1. Tibia, v.2.1.0. p.1.1.1. Metatarsus, v.p.1.1.1. Second leg. Femur, d.0.1.0.0. Tibia, v.2.1.0. p.1.1.1. Metatarsus, v.1.1.1. p.2.1.1. Third leg. Femur, d.0.1.0.0. Tibia, p.1.0.1. Metatarsus, p.1.0.1. r.0.0.1. Fourth leg. Femur, d.0.1.0.0. Metatarsus, p.0.0.1. Trichobothria. Tibia, 2.1.1. Metatarsus, 1.1. Tarsus, 1.1.1. Superior claws of legs 1 and 2 with 6-7 teeth, legs 3 and 4 with four teeth. Inferior claws with single tooth.

**Abdomen** Epigynum smooth apart from small lobe on antero-median surface. Internal genitalia consist of pair of kidney shaped vesicles from which extend moderately convoluted tubes (Fig. 1067).

**Type** Holotype female. Wellington. Orongorongo Valley, 7.ii.1954, McIntyre (Otago Museum).

**Record** Akatarawa Divide, 1,500 ft, leaf litter, 3.i.1947, J. T. Salmon.

Trichobothria, claws, typical.

**Abdomen** Cribellum twice as wide as long. Distal segment of posterior pair of spinnerets one half of length of basal segment. Internal genitalia as in Fig. 1068.

Type Holotype female. Little Wanganui, Westland, leaf litter, R.R.F., C. L. Wilton (Otago Museum).

Neomyro n.gen.

Small (1.5-2.5mm) cribellate spiders. Eyes compact, occupying little more than one half of width of head. AME extremely small and situated well behind ALE. ALE and posterior eyes large and subequal, evenly spaced and forming a ring around AME. Area enclosed by eyes heavily pigmented so that eyegroup is distinctive. Labium notched at base and wider than long. Chelicerae with boss. Retromargin with two teeth. Promargin usually with two normal teeth and row of four closely placed minute teeth. Legs 4123. Preening comb on metatarsi of legs 3 and 4. Trichobothria in double row on tibiae and single row on metatarsi and tarsi. Superior claws similar, strongly pectinate. Inferior claw with one or two teeth. Scopulae, tenent hairs and claw tufts absent. Tarsal organ distinct, at about two thirds of length of segment. Female palp with trichobothria on tibia. Claw strongly pectinate. Six spinnerets, anterior and posterior pairs equal in length. Distal segment short. Colulus small, setose. Epigynum weakly developed. Internal genitalia receptaculate, with both short and convoluted ducts. Male bulb with filiform embolus originating proximally and extending prolaterally along a large membranous conductor. Median apophysis well developed. Tibia of male palp with distal retrolateral plate. Tracheal system limited to abdomen.

Type species *Habronestes scitula* Urquhart

Closely related to *Myro* but separated by the much smaller size, the presence of a well developed median apophysis and a broad spoon-shaped cymbium. These small spiders are found amongst the litter on the forest floor. They are often present in large numbers.

Neomyro scitulus (Urquhart) 1890

1890 *Habronestes scitula*, Urquhart. Trans. N. Zeal. 23: 135.

| Palp | 0.33  | 0.20    | 0.13  |            | 0.35   | 1.01  |

Colour Cephalothorax pale yellow with prominent black patch enclosing eyes. Legs pale yellow. Abdomen with black markings on dorsal and lateral surfaces.

Carapace Width of head 9/14 of width of the thoracic region. Lateral margins straight and parallel. Fovea distinct but narrow.

Eyes Eyegroup compact and occupies 4/9 of width of the head. From in front and above both anterior and posterior rows strongly procurved. AME placed so that PLE and posterior row form a ring around AME. Ratio of AME.ALE.PME.PLE = 2.6.8.7. AME separated from each other by 3/2 and from the ALE by 2/3 of diameter of an AME. Lateral eyes separated by 3/2. PME separated from each other and from PLE by 3/2. MOQ wider behind than in front in ratio of 19.7 and wider behind than long in ratio of 19.15. Height of clypeus three times diameter of an AME.

Sternum Anterior margin straight and lateral margins evenly curved. Posterior projection broadly pointed and separates coxae 4 by one half of width of coxa.

Maxillae Slightly convergent. Outer margins curved. Longer than wide in ratio of 4.3.

Labium Notched at base. Outer margins gently curved. Anterior margin slightly indented. As long as wide.

Chelicerae Length of chelicerae 2/7 of the carapace. Boss present. Retromargin with two teeth. Promargin with four minute teeth followed by two normal teeth and carina which extends to base of chelicera.

Palp Spines. Femur, d.0.1.1.1. Patella, d.1.1.1. Tibia, p.1.2. r.1.0. Tibia with five trichobothria arranged 2.2.1. Claw with six teeth.

## **Subfamily TOXOPINAE Hickman, 1939**

### **Toxopsoides** n.gen.

Medium sized (body length 3-4mm) laterigrade, ecribelate spiders. Eyegroup occupying most of head width. Two rows of four eyes, both strongly recurved. AME larger than ALE. Posterior eyes large. PME separated by a distance equal to the diameter of one of the eyes. Lateral eyes widely separated. Legs strongly spined, 4123, with a double row of long spines along ventral surfaces of tibiae and metatarsi of legs 1 and 2. Trichobothria long and numerous, in a double row on tibiae and tarsi. Tarsal organ present. Superior claws with four teeth, similar. Inferior claw with two teeth. Claw tufts, tenent hairs and scopula lacking. Trochanters not notched. Epigynum weakly sclerotized. Internal genitalia with paired receptacula and long convoluted ducts. Spinnerets with anterior and posterior pairs similar in size; distal segment short. Colulus small. Male palp with filiform embolus curving down the prolateral margin. Radix strongly developed. Conductor membranous. Median spophysis well developed, not hooked. Tibia with distal retrolateral plate. Palp of female with trichobothria on tibia and tarsus. Claw smooth.

Type species *Toxopsoides huttoni* n.sp.

In general appearance this genus is similar to *Toxops* from Tasmania, but it does not seem to be closely related. The ALE are much more widely separated from the PLE. The posterior eyes are similar in size whereas the PLE in *Toxops* is much larger than the PME. The superior claws are provided with an equal number of teeth in contrast to *Toxops* and there are no tenent hairs. The bulb of the male palp seems to be considerably different in detailed structure, with a median apophysis present.

*Toxopsoides* is the third genus of the subfamily Toxopinae to be recorded from New Zealand.

### **Toxopsoides huttoni** n.sp.

Figs. 1084-1088

## **FEMALE**

### **Measurements**

|       | Carapace | length 1.89 | width 1.47 |      |      |
|-------|----------|-------------|------------|------|------|
|       | Abdomen  | length 1.98 | width 1.44 |      |      |
| Leg 1 | 1.60     | 0.66        | 1.62       | 1.26 | 0.61 |
| 2     | 1.53     | 0.63        | 1.32       | 1.22 | 0.43 |
| 3     | 1.51     | 0.55        | 1.26       | 1.23 | 0.54 |
| 4     | 1.89     | 0.72        | 1.74       | 1.80 | 0.81 |
| Palp  | 0.63     | 0.32        | 0.43       | 0.63 | 2.01 |

**Colour** Carapace heavily shaded with black apart from median area from behind eyes to posterior margin of carapace which is unpigmented. Abdomen heavily shaded with black on dorsal and lateral surfaces with number of chevrons on posterior half of dorsal surface. Femora of all legs with prominent black bands, present on other segments but more diffused.

**Eyes** Eyegroup occupies most of width of head. From above and in front both rows strongly recurved (Fig. 1086). Ratio of AME.ALE.PME.PLE = 6.4.9.10. AME separated from each other by 4/6 and from ALE by 3/6 of diameter of an AME. Lateral eyes separated by 5/6. PME separated from each other and PLE by 5/6. MOQ wider behind than in front in ratio of 23.16 and longer than wide in front in ratio of 19.16. Height of clypeus slightly more than diameter of an AME.

**Sternum** Scutiform. As long as wide. Pointed behind between coxae 4 which are separated by 5/6 of width of a coxa.

**Labium** As long as wide. Basal notch absent. Lateral margins straight and slightly convergent. Anterior margin straight.

**Maxillae** Longer than wide in ratio of 17.12. Lateral margins straight and parallel. Anterior margin evenly curved.

**Chelicerae** Strong bristle on proximal anterior surface. Retromargin with two and promargin with five small teeth.

**Legs** Laterigrade. 4123. Superior claws similar, with four teeth. Inferior claw with two. Tarsal organ at 3/4 of length of segment. Trochanters not notched. Clothed with finely ciliate hairs. Spines. First leg. Femur, d.1.1.1. Tibia, 6 ventral pairs. Metatarsus, 5 ventral pairs, second and fifth small. Second leg. Femur, d.1.1.1. Patella, d.1.1. Tibia, 7 ventral pairs. Metatarsus, 5 ventral pairs. Third leg. Femur, d.1.1.1. r.1 subdistal. Patella, d.1.1. Tibia, d.1.1.0. v.2.2.2. Metatarsus, p.r.0.1.2. v.0.2.1. Fourth leg. Femur, d.1.1.1. r.1 subdistal. Patella, d.1.1. Tibia, v.2.1.2. d.1.1.1. p.r.1 subdistal. Metatarsus, v.0.2.1. p.f.0.1.2. Trichobothria long and numerous. Leg 1. Tibia, 1.1.2.1.1. Metatarsus, 6. Tarsus, 1.1.2.2. Leg 2. Tibia, 1.1.2.1.1.1. Metatarsus, 6. Tarsus, 1.1. Leg 3. Tibia, 1.2.1.1.1. Metatarsus, 7. Tarsus, 1.1.2.2. Leg 4. Tibia, 1.2.1.1.1.1. Metatarsus, 6. Tarsus, 5.

**Palp** Tarsal organ subdistal. Claw smooth. Trichobothria. Tibia, 2.2.1. Tarsus, 1.1.2. Spines. Femur, d.0.1.1.1. v.0.1.0.2. Patella, d.1.1. Tibia, v.1.0. p.2.2. r.0.1. Tarsus, many.

**Abdomen** Six spinnerets with anterior and posterior pairs of equal length. Distal segments short. Colulus small, anterior margin evenly curved and setose. Epigynum simple (Fig. 1087). Internal genitalia with a large spherical receptaculum and coiled ducts (Fig. 1088).

## **MALE**

### **Measurements**

|       | Carapace | length 1.71 | width 1.47 |      |      |
|-------|----------|-------------|------------|------|------|
|       | Abdomen  | length 1.62 | width 1.17 |      |      |
| Leg 1 | 1.98     | 0.75        | 1.98       | 1.47 | 0.73 |
| 2     | 1.98     | 0.72        | 1.80       | 1.44 | 0.72 |
| 3     | 1.80     | 0.64        | 1.62       | 1.51 | 0.69 |
| 4     | 1.87     | 0.68        | 2.07       | 2.03 | 0.86 |
| Palp  | 0.73     | 0.39        | 0.25       | 0.68 | 2.05 |

Similar in general structure to female. The palp is shown in Figs. 1084, 1085.

Embolus filiform, originating distally and curving back down the prolateral surface along margin of membranous conductor. A complex structure occupying anterior portion of the bulb is a form of radix projecting from base of embolus and curving towards cymbium before bending down into a curved tongue. Median apophysis developed but not hooked apically. In the illustration it is shown on the left side of bulb. Tibia has a large distal plate on retrolateral surface and a small spinous process at base of plate.

**Types** Holotype female, allotype male. Hawkes Bay, Waitetola, R. W. Hutton (Otago Museum).

**Record** Same data as types. This spider was collected from beneath stones and fallen logs. It is presumed to be a vagrant.
